

The pet-treat business system manual

Marketing + how the storefront, the app, the cloud and updates work

Version 65 · follows the app's Engine v65 · rebuilt with every change

1 · About this guide

This PDF is your manual and your memory for Munchies Furkidz, your pet-treat business, which lives on the web at munchies.com.my. It holds everything that matters: the marketing basics (you are new to this - that is exactly what this guide is for), how the whole order system works, how to use the storefront and the app step by step, what each screen means, plain-English explanations of the cloud (Supabase), the hosting and how updates reach your phone, the nationwide-postage way of working, and a growing log of every question you ask with its answer.

It is rebuilt from a master file whenever we add something - a new feature, a new question, a change to how orders work - and the version number on each page goes up. If a chat conversation ever gets compressed or you cannot scroll back to an old reply, the answer lives here. The product names, prices and sample figures in the app's sample data are the practice set (section 5 shows how to load it); the real list replaces them before you open for orders, and this guide is rebuilt then.

- 2 - Your channels at a glance (what each is FOR).
- 3 - The whole system in one picture (the map).
- 4 - The storefront: the customer's order page, and how you publish it.
- 5 - The app: your screen-by-screen guide (every tab and every button).
- 6 - Settings: everything explained, card by card.
- 7 - Two phones: shared data (the cloud).
- 8 - The app password lock.
- 9 - Where the app lives & how updates reach you (hosting + Supabase).
- 10 - The rules & small print (selling pet food from home).
- 11 - Quick start - do this week.
- 12 - Questions asked so far (the log).
- 13 - Failure-mode analysis: the 'N left' problem and the fixes made.
- 14 - Failure-mode analysis: the 'isn't on WhatsApp' glitch and the fixes made.
- 15 - Order alerts: your phone pings when an order lands.
- 16 - Promotions & social media - your marketing playbook.
- 17 - Daily & weekly routine - message of the day, the weekly report + your Home to-do list.
- 18 - Bring-a-friend: the personal link, the credits, and the follow-up that asks for a referral.
- 19 - Pouch pricing study - the meat cost, the drying yield and the price.

2 · Your channels at a glance

WhatsApp = where the order is confirmed and paid. Chats, confirmations, the TNG payment QR, payment receipts and repeat customers all live here. This is the channel that closes the sale. The business version (WhatsApp Business) is free and adds a business profile, opening hours and a photo catalog.

Instagram = the shop window. Beautiful photos of the treats make people want to buy, and Instagram sends them to a single tappable link - the order page.

Facebook = wider reach and the home base. A page with an Order button, posting to local groups, and reaching an older, family-and-friends crowd.

Golden rule: Instagram and Facebook bring people in, WhatsApp confirms and takes payment, and the app turns orders into a purchase list.

3 · The whole system in one picture

Here is the whole system in one picture. Each numbered step says who acts - the customer or the maker - and they meet over WhatsApp. Read it top to bottom.

```

+-----+
| 1  MAKER posts a photo of the treats |
|      (Instagram / Facebook / WhatsApp status). |
+-----+
|
|      v
|
+-----+
| 2  CUSTOMER taps the ONE link - the STOREFRONT order page |
|      opens. She picks a posting day and her pouches, and |
|      types her name, WhatsApp number and postal address. |
+-----+
|
|      v
|
+-----+
| 3  CUSTOMER taps Place order. The order is saved straight to |
|      the app, and WhatsApp opens with a copy of it - she |
|      presses Send so the maker can reply in the chat. |
+-----+
|
|      v
|
+-----+
| 4  MAKER sees the order in her app and confirms it. WhatsApp |
|      sends the customer a confirmation with an order # (e.g. |
|      #A3F9C2), the date, items + total + postage, and the QR. |
+-----+
|
|      v
|
+-----+
| 5  CUSTOMER pays by TNG - scans the QR and puts her phone |
|      number in the payment description. |
+-----+
|
|      v
|
+-----+
| 6  CUSTOMER sends the TNG receipt screenshot back in the chat. |
|      MAKER matches it to the order # and marks it PAID. |
+-----+
|
|      v
|
+-----+
| 7  CUSTOMER watches the order move with her # - the track |
|      link shows it live: New -> Confirmed -> Paid -> Preparing |
|      -> Packed -> Delivered. |
+-----+
|
|      v
|
+-----+
| 8  MAKER dries, packs and posts the treats on the posting day |
|      - nationwide post (Mon / Wed / Fri). |
+-----+

```

Instagram and Facebook are the front door - they bring people in. The **order page is the one link** every post points to: it takes the order and it doubles as the track-your-order page. **WhatsApp is where the order is confirmed and paid** - the confirmation message carries the order number and the TNG payment QR, and the customer sends her payment receipt back in the same chat. Your **app turns confirmed orders into the exact ingredient list** for the batch.

A customer can also just message you directly ('2 chicken jerky for Friday?'). Same path - you add it by hand and everything downstream is unchanged.

This business works by **nationwide post**: the treats are shelf-stable, so on each posting day you pack the

pouches and post them. There is a **flat postage fee** per posted order - it is your charge, added when you confirm the order on WhatsApp, never shown on the customer's order page (section 4 explains this fully). Local customers who prefer to collect can still choose Collect.

Four moving parts appear again and again in this manual, so meet them now: the **storefront** (the page customers open - section 4), the **app** (the pages you use every day - section 5), **WhatsApp** (the messages and the money), and the **cloud / Supabase** (the online shared notebook that carries orders between the storefront, your app and your two phones - sections 7 and 9).

One link, one message, one app, one QR. Every marketing post is just a different way to start this same loop.

4 · The storefront - the customer's order page

The storefront is the page every marketing post points to (it lives at your website address with /store/ on the end). It is not a separate app - just one web page on your customers' phones. Below is roughly what the customer sees, top to bottom; then comes how YOU make and publish it.

What the customer sees:

```
+-----+
|                                     |
| Munchies Furkidz                  |
| Handmade dehydrated pet treats    |
| Made to order - closes 18:00      |
| the day before                    |
| Posting days   Mon - Wed - Fri    |
|                                     |
| PICK A POSTING DAY                 |
| [Mon 7 Sep] [Wed 9 Sep] [Fri]     |
|                                     |
| WHAT WOULD YOU LIKE?              |
| Chicken Jerky      [-] 2 [+]      |
| Duck Jerky         [-] 1 [+]      |
| Sweet Potato Chews Only 8 left    |
|                                     |
| YOUR DETAILS                      |
| Your name          [ Aisyah ]     |
| WhatsApp number    [ 012-3456 ] * |
| (Post - nationwide) (Collect - local) |
| Postal address     [ 4, Jalan Bunga, KL ] |
| Note (optional)    [ extra soft ]  |
|                                     |
| TRACK YOUR ORDER   [ A3F9C2 ][Go] |
|                                     |
| 3 items - RM59.00   [PLACE ORDER] |
|                                     |
+-----+
```

- **1. The top.** Three small language buttons near the top let the customer read the WHOLE page in English, Mandarin (Chinese) or Bahasa Malaysia - every heading, button, weekday name, 'N left' and 'Sold out', even the track-your-order page, switches over on the spot, and the page remembers the visitor's choice for next time. English is the default. The homepage carries the same switch, so one link serves every customer in their own language. Below the switch sit your business name, your tagline, 'Made to order - closes {time} the day before', and the posting days. Product names follow the language too: if you

have typed a Chinese or Malay name for a product (Products -> Edit -> Shop names, section 5), shoppers reading in that language see it; until you do they simply see the English name. This tells them the rules before they order.

- **2. Pick a posting day.** Days that are still orderable appear as buttons, one per date. A day that has been cut off or is fully booked greys out - the date stays readable and a clear red 'Sold out' badge sits under it, and the day cannot be tapped. Posting days are Mon / Wed / Fri.

- **3. What would you like?** One card per product (a pouch, its price), with a - and + to set how many. When Live availability is on (section 6), a card shows 'Only N left' as it sells down, or 'Sold out' when that product is gone for that day. Your app's Products screen is what fills this list. The page refreshes itself every ~30 seconds while it stays open (and again the moment the customer returns to it), so sold-out days and counts update on their own - a customer never has to reload, and nothing they have already typed or chosen is disturbed. If something they chose sells out (or drops below the number they asked for) while they are still ordering, the page quietly fixes it for them before they can place the order and shows a small note above the menu.

- **4. Your details.** Their name, and their WhatsApp number (marked *, required - it is how the confirmation and the payment QR reach them). Then they choose **Post - nationwide** (the normal choice, which opens a required **Postal address** box) or **Collect - local** for pickup by arrangement. A note box is optional.

- **5. Place order.** A bar sits at the bottom: '2 items - RM22.00' and a big PLACE ORDER button. The button stays grey until they have picked a day, at least one item, and their name + WhatsApp. **The total does NOT include your postage fee** - that is added by you over WhatsApp when you confirm (below). The customer is told about the fee on the homepage and in your confirmation message.

- **6. After they tap Place order.** The order is written to the cloud and lands in your app's New Orders inbox within about 30 seconds (tagged 'storefront'), and the page shows a green 'Order received!' card telling them you have their order and will WhatsApp them once you confirm it. WhatsApp does NOT pop open on its own any more - it opens only as a safety net if the order somehow cannot reach the app, so a message is never lost.

- **7. Track your order.** A box further down, and a link in the confirmation message. They type the letters after the # (e.g. A3F9C2) and see the order's whole journey drawn as a parcel-style progress line - New, Confirmed, Paid, Preparing, Packed and Delivered. Steps already reached are ticked green, the step waiting on you is the highlighted (pulsing amber) one, and the rest stay grey. The line is the SAME map you see in your app: Confirmed only turns green after you press Send confirmation, and Paid only after you press Paid - so the moment you tap one of those, the customer's page moves with you. They also see their items, total and, for a posted order, their postal address.

Your side: making and publishing the storefront. You do this inside the app (More -> Settings -> the 'Storefront (customer page)' card). There is no separate website builder.

- Business name - shown at the very top.

- WhatsApp number - the number customers message; type it as digits only WITH country code, so 012-345 6789 becomes 60123456789.

- Tagline - the short line under your name, e.g. 'Handmade dehydrated pet treats'.

- Instagram and Facebook - your handles, shown as tappable links at the bottom of the page.

- TNG QR image link - the internet address of a picture of your Touch 'n Go payment QR, so the confirmation message can show it for scanning.

- Each box saves the moment you finish it and publishes to the storefront by itself - customers see the change within seconds, no GitHub or redeploy needed. The 'Publish now' button is there to force an instant publish if you ever want to be sure.

- **Your postage fee is set in its own card** - 'Postage (nationwide posting)', right under Storefront. Type the flat fee per posted order (default RM 8). When you send a WhatsApp confirmation for a POSTED order, your app adds 'Postage (nationwide): RM 8.00' and shows the customer the true 'To pay' total. Blank or 0

means no postage line appears - useful if you later decide postage is free. The figure is shared between your phones (whichever phone you set it on last wins, so both quote the same) but is **never published to the storefront** - customers only ever hear the exact figure from you on WhatsApp.

- **What customers see is never pre-printed or baked in.** The name, WhatsApp number, tagline and socials are read fresh from the cloud, so whoever last saved these boxes is the version the order page shows - and every phone shows the same latest version.
- The menu, prices and 'Only N left' come from your Products and from Live availability (sections 5 and 6) - not from these boxes.

Try it as a customer: open the storefront on your own phone, place a tiny test order, and watch it land in your app's New Orders. Then mark it Delivered so your records stay clean.

5 · The app - your screen-by-screen guide

This is the business side - the pages YOU use. First, one-time setup: in Safari, open the app at **your address/admin/**, tap Share and choose 'Add to Home Screen' so it opens full-screen like a real app (it also works offline). When it opens it asks for your 4-digit password (section 8) and then the sign-in screen (section 7). Everything you type is saved on the phone as you go - there is no Save button to forget. The storefront details the app shows are pulled fresh from the cloud when it opens - nothing is pre-printed, so a new phone is always current.

The layout. Five tabs sit along the bottom: **Home, Orders, Products, Customers, More**. Each is a different job. A small red number appears on Orders when there are new orders waiting for you. More holds the other screens: **Purchase Order (PO), Suppliers, Delivery dates, Ingredients, PO history, Units, Reviews** and **Settings**, plus the app's **Guide**. The More header carries a small green **Engine pill** that shows which version of the software this phone runs, and **Full change history** opens a PDF listing every version from v54. At the very bottom of More sits the **Software wish list** - your own idea notebook for the app: add a feature you would like, tick one off when it comes true (a tick stays ticked - it never resets weekly), reword or remove it. Adding a wish also offers it to your developer: once a developer email is set (Settings -> **Website & developer**, section 6), the app emails the FULL wish list - every wish, ticked or not, newest first, with the app version and the date - to that address on its own, and a small 'Email the full wish list' row on the card lets you send it by hand any time (that row is how the list travels until the email service is switched on). The same card shows who built your site: under **About** in the More header, the developer's WhatsApp and email appear as tappable rows once you set them (section 6).

Home (the dashboard). Your day at a glance. Near the top sits a '**Coming 4 weeks**' card: one line per week (each week runs Mon-Sun, starting from the next Monday), showing that week's posting days, the pouches already booked, the estimated money in RM and how many free slots are left. Tap a line to open that week's orders, or tap one of its small date chips to open that exact date. The **weekly to-do** sits on Home too (section 17). Below them, **Upcoming deliveries** shows your posting days as fuel-gauge dials - a half-circle painted red on the empty third, amber in the middle and green at full, with a needle that points at how booked the day is and the numbers underneath (e.g. '3/12'). Green means there is still room, amber means it is nearly full, and red ('Over') means you have more orders than capacity - that is fine only if you agreed to make extra. Dates beyond the four weeks sit in a 'Later dates (n)' expander. The + New order button opens the order form, and 'Generate next delivery dates' appears when you have no dates yet. Ordering closes the evening BEFORE each posting day, at your cut-off time. An **Upcoming holidays** card also sits on Home: it shows the days you have marked on the Delivery calendar (up to three at a glance - any more scroll), and when you have marked none it gently points you to the calendar so you can add some. It never vanishes now, quiet week or not.

Orders (the heart of the app).

- New Orders inbox - a red card at the top that lists every order still marked New (meaning you have not handled it yet), across ALL posting dates, oldest first, each tagged 'storefront' if it came from the order page. Tap a row to jump to that date. This is the first place to look each morning.
- Date tabs - below the inbox, one tab per posting date with an open/closed dot. Tap a date to see only that day's orders.
- Find an order - a search box at the very top. Type any part of an order - the customer's name, the order number (e.g. 3BA44E, with or without the #), their WhatsApp number, what they bought, the delivery method ('post', 'nationwide') or a note - and every matching order from ANY date appears below, newest first. Tap a result and the app jumps to that posting day, brings the order into view and flashes it. It finds an order from months ago as easily as one from today.
- Every row carries its order number as a tag (e.g. #A3F9C2), so any WhatsApp message can always be matched back to the order it belongs to. An order row shows: what was bought ('Chicken Jerky + Duck Jerky' with each item and quantity), the customer's name · WhatsApp · note, 'Placed today at 14:02', a tag - Post (nationwide) or Collect (local) (with the postal address for a posted order), the status dropdown, and the action buttons. Under every row sits its own mini status map - six dots, New · Confirmed · Paid · Preparing · Packed · Delivered - with the steps reached in green and this order's current step as the pulsing amber dot. Change the dropdown and the dot moves.
- A storefront customer who ordered several things arrives as ONE row with ONE status and ONE order number - handle it as a single order, not many.

Working an order - the daily routine:

1. In the New Orders inbox, tap the order. Change its status from New to **Confirmed** - the map now shows Confirmed as the flashing amber step and a **Send confirmation** button appears. An order without a WhatsApp number cannot move to Confirmed (the app says 'Add the customer's WhatsApp first (tap Edit on the order)'); storefront orders always come with one, but orders you type by hand may not.
2. Tap **Send confirmation** - WhatsApp opens with the message already drafted (order #, the date, items + total, and for a POSTED order the postage line and the true 'To pay' figure, plus the TNG payment QR and a track link) and you just press Send there. That tap is what turns Confirmed green on the map and makes Paid the flashing next step. Nothing is ever sent to the customer without this tap.
3. Watch for the customer's payment. The moment their TNG receipt comes back in the chat (and matches the order number), change the status to **Paid** - the buttons become **Send payment reminder** (a WhatsApp nudge with the order number and QR, for anyone who has not paid yet) and **Paid**. Tap **Paid** only once the payment is really in - that turns Paid green and Preparing becomes the flashing next step.
4. As you dry and pouch the order, move it to **Preparing** (no message - the map just advances), and its row now shows **Print label** - tap it, see the label live, pick the style you want, then press **Print** and stick it on the pouch or parcel. Print it BEFORE you move on: you need the label in hand to KIT the order (each label says which pouches go in that parcel). Only when an order is boxed and ready do you move it to **Packed**, which shows a **Send posting reminder** for a posted order (or 'Send pickup reminder' for a collect order). Collect orders offer **Full, Compact and Name-only** label styles - the label carries your business name, the day, the order number, the customer's name and the items. **Posted** orders get a fourth style, **Mailing**, already chosen for you - a parcel label with three blocks: FROM (your postal address from Settings -> 'Mailing labels (post)', section 6), TO (the customer's name, phone and postal address), and ORDER (the number, posting day and items). Finally move it to **Delivered** and the whole map turns green. Customers watch the same steps on their own track page, so you rarely get 'where is my order?' messages.
5. **Edit** opens a small pop-up over the screen (the + **New order** form stays put underneath, so a manual order can always be added) - fix the WhatsApp number, change quantities, the postal address or the delivery method, or add more items to the same order. The product lists in + **New order** and **Edit** show every product, including ones you have hidden from the menu - hidden ones are marked '(hidden)'.

6. **x (remove)** deletes an order - it always asks first, and it also frees that slot so the storefront can sell it again.

- If a day is full and you add one more order, the app warns you the day is over capacity - you can still add it if you will really make extra.

Adding an order by hand. Someone messages you '2 chicken jerky for Friday'? Tap + New order: choose the product and quantity, type the customer's name and WhatsApp number, pick the posting date, choose Post (nationwide) and type the postal address (or Collect), add a note if needed, and save. It behaves exactly like a storefront order from there.

Products (your menu). This list is also what customers see on the order page. Each product shows its selling unit, its price and its recipe. To add one: give it a name and pick its selling unit from the dropdown (pouch, pack, jar, box... - the count units from More -> Units, seen by customers as 'RM22.00 / 100g pouch'), then a sell price in RM, and its recipe - the ingredients and amounts for ONE unit (this is what makes the PO work). The Recipe card shows, under each filled line, how that line's cost is counted - e.g. '160 g × RM 0.013 = RM 2.08' (the amount, times that ingredient's cost per gram from More -> Ingredients) - and below the lines a small 'How it adds up:' list adds every line's RM and lands on the same 'Est. ingredient cost / unit' total above, so you can read top to bottom what one pouch costs to make and which ingredient costs the most. Each line also shows its share of the total as a percentage. A line with no cost set shows 0%. Every ingredient line can also carry a short private note about that ingredient for THIS product only (e.g. which cut or brand of meat, or which variety of sweet potato), typed under the line and seen only by you on the Products screen - never on the shop, a label, or the product cards. If an ingredient only has a supplier pack price (e.g. chicken breast RM 13 / kg at the wet market, entered under More -> Ingredients) and no per-gram number, the line still prices itself - the app divides the pack price by the pack size, so 160 g reads '160 g × RM 0.013 = RM 2.08'. Only a line whose ingredient has neither a pack price nor a per-unit cost reads 'no cost set' and is counted as RM 0.00. Pick another product as a line instead (a set, e.g. '2 × Chicken Jerky') and that product's own recipe cost is used automatically. You can set an optional 'daily limit': how many of that product you will make per posting day (limits add together, so 12 chicken + 12 duck = 24 pouches). Tap **Edit** on any product and the same form opens in a small pop-up. 'Hide' keeps the product for past orders but stops new ones; 'Delete' removes it completely. Two optional **Shop names** boxes sit under the product's name (the little 'Shop names (optional)' card) - one for Mandarin (Chinese), one for Bahasa Malaysia. Type what shoppers reading in that language should see on the order page (e.g. 'Jerky Ayam' for a Chicken Jerky) and their product card shows it; leave a box blank and those shoppers simply see the English name. The English name stays the REAL one - your app, your labels and your order history keep using it, and nothing you type in a Shop names box can change it.

Value packs - a product made from another product. You can sell a bigger version of one item (such as a mixed 'sampler box') without re-typing its recipe. In the product's Recipe card, tap + **Add product** instead of + **Add ingredient** - the row is a drop-down of your other products plus a quantity, so one line '2 × Chicken Jerky' makes the whole pack. Its cost and your PO work out by themselves, and if you ever change the Chicken Jerky recipe, every pack that uses it follows. A pack whose recipe is exactly ONE product and which has NO daily limit of its own shares that product's daily pool: give the single Chicken Jerky a daily limit of 12 and the pack draws from the same 12. A pack with several products in it counts on its own instead - give it its own daily limit if you want it capped.

Delivery-date rules - two optional boxes per product. Under 'Daily limit', each product has two more boxes that decide WHICH delivery dates it can be ordered for. '**Orders close (days before delivery)**': type a number and a customer must pick a date at least that many days ahead - something needing 3 days' notice types 3. '**Available for delivery dates**': type a From and a To date for something seasonal. Both are optional and belong to that product alone. Leave them empty (or 0) and the product is orderable on any open posting day. When a customer picks a date the product is not open for, its card shows Sold out with a short note saying why.

PO (your purchase list, under More -> PO). Pick the posting date and the app multiplies every order by its recipe and adds it all up - then sorts the list by shop. Against each ingredient's need the app first counts what your **On hand** stock already covers (a line can read 'have X', so only the shortfall is bought), then tops the ingredient back up to its **Keep at least** level if the stock has dropped more than 10% under it (shown as 'keep Y on hand') - even when that day's orders do not use the ingredient - and finally buys what is still open from that ingredient's **CHEAPEST** supplier, in whole packs, showing exactly what to take, like 'Chicken breast: 2 × 1 kg (need 1,600 g)'. The lines group under their supplier with that shop's subtotal, and each shop group carries two buttons: **Copy order** - the exact message to paste into that supplier's WhatsApp - and **Message supplier**, which opens WhatsApp with that same order text already typed - just press send. Any ingredient without a supplier price stays as a loose amount with an estimated cost. Then tap 'Generate & Save' to keep an exact snapshot in PO history (it never changes later, even if orders do), or Print to take it to the shop. Saved lists are under More -> PO history.

Customers (a tab of its own now). The people who buy from you - one row each, built automatically from your orders, showing how many orders, roughly how much they have spent, their favourite product and their last order. A **Finder** box sits at the top: type any 2+ characters (a name, a WhatsApp number, a pet's name, a like, a note, a favourite product) and the list narrows live with 'N of M match'. Tap a person and their history pop-up leads with a **profile card** - tap **Edit** (or **Add details**) to keep a small profile per person: their pet's name, a **photo** (the app shrinks it to a small thumbnail automatically before saving), what they like, what to avoid, and a note. Profiles ride the same customer list on both your phones and grow quietly as orders do. The rest of the screen is your messaging: a **Chat** button opens WhatsApp with a ready 'Hi {name}!' greeting, 'Who to look at' narrows the list (everyone / has a number / ordered in the last 30 days / quiet for 30 days), and to run a marketing message: **Pick who to message**, tap the people you want, type your note, then **Copy numbers** or **Copy greeting** - one ready line per person starting 'Hi {name}, ...'.

More - the extra screens:

- Suppliers - the shops you buy from, each with its WhatsApp number. The PO uses these names to group your shopping by shop and to open the chat when you are ready to order.
- Delivery dates - create your posting days on a month calendar: tap one or more future dates, then tap **Add selected** (the button shows how many you picked). Dates you already added are ticked green on the calendar, past dates are greyed out, and the arrows page through the months. Deleting a date only removes the date - past orders stay in history.
- Mark an occasion - a reminder you paint on the calendar - a public holiday, a school-holiday week, CNY, Hari Raya, Mid-Autumn. Slide from the first day to the last (or tap the first day, then the last). First pick its colour from the eight round colour buttons, then type its name. Every mark is drawn as its own rounded 'sheet' over exactly the days it covers. **Add occasion** opens a ready-made catalogue to fill the calendar in one go: the dates Malaysians across the Peninsula celebrate, grouped under headings (Festive, National, State & territory, Love & family, School holidays, Fun & pet days, Baking & sweet days, People & kindness)
- tick the box beside a heading to grab that whole group, untick any you don't want, and a red dot marks an official public holiday, orange the rest. A **My own day** box lets you type an occasion the list doesn't have (e.g. a promo day of your own). A mark NEVER adds or removes a delivery date - it only reminds you. Every mark you paint also shows on Home's **Upcoming holidays** card, which is always there now - up to three at a glance, a scroll for any more.
- Ingredients - the master list of what you buy. Each ingredient has its cooking unit (g, kg, ml...) and as many supplier prices as you like - a pack size + price per supplier, like chicken breast RM 13 / kg at the wet market and RM 26 / kg online (add another row for every shop you might buy from; the PO always picks the cheapest). A pack price is enough on its own. The optional per-unit cost box is only the fallback for an ingredient with no pack price. Under the prices, every ingredient card also carries TWO stock lines you tap to set: **On hand** and **Keep at least**. **On hand** is how much of the ingredient you have on the shelf right now (type it in any unit of that ingredient's family - g or kg, ml or L) - the PO only buys what this does not already

cover, and when you mark an order **Preparing**, its ingredients come off your on-hand stock automatically. **Keep at least** is the floor you want left after a busy posting day - the shopping list tops the ingredient back up to that level (in whole packs) whenever it has dropped more than 10% below it, even if that day's orders do not use it. Tap **No minimum** on the pop-up to switch the floor off again. An ingredient sitting below its floor shows '· low' in red on its On-hand line, and a red banner 'Low stock - below your keep level' appears at the top of the Ingredients list naming everything to re-buy. Both numbers live on the ingredient, so they sync across your phones like the ingredient does.

- PO history - every purchase list you saved, ready to open, print or regenerate.
- Units - how you count and measure things (g, kg, ml, L, plus min and hr for times and cm and m for lengths) AND the selling units (pcs, pouch, pack, jar, box, bag, set, piece), which come pre-loaded. Each unit belongs to a family - weight, volume, count, time or length - and knows its size: a kg is 1,000 g, a L is 1,000 ml, an hr is 60 min, a m is 100 cm, a piece is one. That is what lets the PO turn 'need 1,600 g' into whole '2 × 1 kg' bags. This is ALSO the one place where you add or alter a selling unit: a Count-family unit you add here becomes a choice in every product's Unit dropdown.
- Reviews - the reviews customers leave on your homepage land here first, all waiting for you. Nothing goes public until you tap **Publish** (it then shows in the homepage's 'What customers say' section); **Take down** hides one again, **Delete** removes it for good. Reviews can arrive in English, Mandarin (Chinese) or Bahasa Malaysia, and with a photo. Reviews play here ONE AT A TIME, each drawn exactly as it will look on your homepage - photo, stars, the full message, then the name, with the language and date underneath
- the ones waiting for your **Publish** first, then the ones already live. A review stays in front of you until you move it (a swipe, the arrow buttons, or a dot under it) - it never slides by itself while you are deciding. How many are waiting shows on the Reviews row itself (a green 'N waiting' pill), in a line at the top of the Reviews screen, and on a Home card, 'N new review(s) to publish', that taps you straight in; the count refreshes every ~45 seconds while Home is open. Publish puts the review on the homepage and moves you on; the homepage shows your published reviews one at a time as an automatic, swipeable carousel, where visitors can swipe or tap the arrows and dots. A customer review is one of the rare messages the PUBLIC can send you - approve each one before it shows.

Message your customers - step by step. WhatsApp can only send to one person at a time, so the app prepares one ready message PER person (each starting with their name) and you paste them one chat at a time:

1. Open the Customers screen. Optional but useful: set 'Who to look at' to 'Ordered in the last 30 days' for your recent buyers, or 'Quiet customers - no order in 30 days' when you want to bring people back.
 2. Tap **Pick who to message**, then tap each customer's name to tick it (a tick appears). 'Pick all shown' ticks everyone on the current list; the line above the message box counts what you have, e.g. '3 of 5 picked'.
 3. Type your message in the 'Your message' box - just the body, not the name (e.g. 'your order goes out on Friday - the chews are extra soft this week!'). A preview underneath shows how it will start.
 4. Tap **Copy greeting** (it shows how many). Now open WhatsApp, go to the FIRST person's chat, paste, and delete the other people's lines so only that person's message stays, then press Send. Repeat for each person.
- Two shortcuts: **Copy numbers** copies just the phone numbers (one per line) if you would rather start each chat from your contacts yourself, and the small **Chat** button beside any single customer opens WhatsApp straight to them.
 - Only customers with a saved WhatsApp number can be messaged - someone without a number is simply skipped.

Add or change a selling unit - step by step. Products sell in units from the list (pouch, pack...), and that list is managed in ONE place: More -> Units.

1. Add a new one: open More -> Units and use the 'New unit' card at the top. Type the name (e.g. jar).

2. In the family dropdown choose **Count (pcs...)** - Count is the family the product screen offers as selling units. Tap **Add unit**. It now appears in every product's Unit dropdown.
 3. Change one: find its card in the Units list, tap **Edit**, fix the name, tap **Update unit**.
 4. Put it on a product: in Products, tap **Edit** on the product and pick the unit from its Unit dropdown.
- Only Count-family units appear as product selling units (Weight g/kg and Volume ml/L stay for ingredient units and the PO). Renaming a unit does not rewrite products already saved with the old name - re-pick the unit on those products. And a unit still used by a product or ingredient cannot be deleted.
 - Settings - every control lives here; the next section walks through it card by card.

*Anything you delete can be re-typed; nothing here is one-way. Your real safety net is Settings -> **Backup & safety** - the cloud copies it saves on their own each day, plus the Download / Export files you can keep somewhere safe.*

6 · Settings - everything explained

Every control you have is on one screen: **More -> Settings**. The cards appear top to bottom in this order. If you are ever lost about a switch, this is the list to check.

- **1. Delivery settings.** Tick which weekdays you post (Mon / Wed / Fri). Set the order cut-off time - the time the evening BEFORE a posting day when orders close (e.g. 18:00). Set the default capacity per day - the number of orders you take when a product has no daily limit of its own. Changes save as you make them.
- **2. App password.** The 4-digit lock for this phone. A fresh phone starts with the standard password 8899 already switched on - change it to one only you know. Full guide in section 8.
- **3. Storefront (customer page).** The boxes that control the order page - business name, WhatsApp number, tagline, Instagram, Facebook, TNG QR image link. Every box publishes itself; 'Publish now' forces it. Full guide in section 4.
- **4. Postage (nationwide posting).** Your flat posting fee per posted order. Type the RM figure and, from then on, every WhatsApp confirmation you send for a posted order shows 'Postage (nationwide): RM x.00' and a true 'To pay' total (section 4). Blank or 0 = no postage line. **The figure is shared between your phones** - whichever phone set it last wins, so both quote the same amount (section 7) - but it is **never published to the storefront**, so customers never see the fee until your message.
- **5. Website & developer.** Whose website this is and who your software wishes go to. Type the developer's **name**, then one or more **email addresses** (**Add another email** adds another box; the x beside one removes it) and, optionally, the developer's **WhatsApp** number - type it as digits WITH the country code, so 012-345 6789 becomes 60123456789. Nothing shows on your pages until a name AND at least one way to reach the developer are set (an email address or the WhatsApp number). Once they are, a small 'Website by [name]' credit appears at the bottom of your homepage AND your order page: if a WhatsApp number is set, the developer link there opens WhatsApp with a ready 'Hi!' already typed, and the email address(es) stay as a smaller link underneath. The same developer also appears under **More -> About**, one tap away. The email address(es) are who receives the email when you add a software wish on the More screen (section 5). A WhatsApp number on its own still shows the credit, but the wish-list email needs an email address to send to.
- **6. Referrals (bring-a-friend).** The deal: a friend who is NEW to you gets money off their first order and the referrer earns a credit - one credit per NEW friend. Three boxes set the amounts (RM off the friend's first order, RM credit to the referrer, and how many days each credit stays valid - blank means never expires) and a switch turns the whole thing on and off. Full guide in section 18.
- **7. Mailing labels (post).** Your business postal address for posted parcels. Type it once, one line per row - first line your business name, then the street, area, town, postcode and state, and your phone on the last line. It prints as the FROM block on the Mailing parcel label (section 5). Type it on each phone you print

labels from.

- **8. Live availability (Supabase) - the cloud connection.** Four boxes: the Supabase URL, the anon key, the app login email, and the app login password. These four are the same on every phone and for every cloud feature - think of them as the address + key + login to your online shared notebook. Switch 'Enable live availability' ON and two things happen: your app starts pulling storefront orders into the New Orders inbox (checked every ~30 seconds), and the order page starts showing how many slots and products are left ('N left' / 'Sold out'), updating automatically as orders arrive. 'Sync now' forces an instant check. **You never lose the address + key:** they are built into the app, so if they are ever blank on a phone, the app refills them by itself every time it opens. The only things YOU type on a phone are the app login email and password.
- **9. Shared data (cloud).** The two-phone sync. Switch it on and the app restarts to ask you to sign in with the app login email and password. Full guide in section 7. It uses the same four connection details from card 8. (The postage fee in card 4 syncs too, through this shared row, so both phones quote the same - it just never reaches the public storefront.)
- **10. Backup & safety.** Two layers protect you. First, **cloud copies:** every time you open the app while signed in, a full snapshot of your records saves to your own cloud on its own - a **Daily** copy the first time you open it each day, a **Weekly** copy on the first Monday of the week you open it, a **Monthly** copy on the 1st. The newest 7 daily / 4 weekly / 3 monthly are kept; older ones tidy themselves away. The card lists your recent copies, newest first; each can be **Viewed** (a purely read-only look inside that copy - its orders grouped by posting day, the product price list and the ingredient stock at that time; looking never writes or moves anything), **Restored** (steps your phone back to that copy - a 'Before restore' copy is saved first, so it is never one-way - and your other phone follows on its next sync), **Downloaded** as a real file (named like 'furkidz-backup-2026-09-08-daily.json'), or **Deleted**. A **Back up to cloud now** button saves a Manual copy that stays until you delete it. Second, the original **Export / Import:** Export backup saves ALL your data to one file on your phone (named like 'furkidz-backup-2026-09-07.json') - keep it somewhere safe, useful for a brand-new phone. Import backup restores from a file and only accepts a genuine backup from THIS business - another app's backup is refused. Downloads from your cloud copies re-import through the same Import. Cloud copies never hold your per-device secrets (the app login email/password and your app password stay on the phone).
- **11. Danger zone.** 'Delete all data' wipes everything on this phone - it asks you twice. Only use it to truly start over. When the app is empty, a 'Try sample data' card appears so you can practise with made-up orders (chicken jerky, duck jerky, sweet potato chews) before going live.

If a switch seems to do nothing, check the card above it - most cloud cards need the four Supabase details filled in first.

7 · Two phones: shared data (the cloud)

You may run the same business on two phones (yours and a helper's - at home and at the market).

'Shared data' keeps both phones on the same orders, products, ingredients, suppliers, units and posting dates. It is optional - without it, each phone only holds what was entered on it.

1. On each phone, open More -> Settings -> 'Live availability (Supabase)' and enter the SAME four things: the Supabase URL, the anon key, and the app login email and password (section 6, card 8).
2. On each phone, open the 'Shared data (cloud)' card and switch 'Enable shared data' ON. The app restarts and asks you to sign in - type the same app login email and password on both phones and the data comes back from the cloud.
3. Done. When one phone changes something, the other catches up on its own within about 30 seconds. The Sync now button only forces an immediate check.

It works offline too: edits made with no signal wait and push when the connection returns. Orders, products,

ingredients, suppliers, units, posting dates and your postage fee share across phones. The app password (section 8) never shares - set it on each phone. The postage fee does share (section 6, card 4) but only between YOUR phones; it never reaches the public storefront.

- **'Not sharing right now'**. Whenever a phone is NOT part of the shared cloud - the switch is off, the phone was never set up, or you signed out - a thin amber strip sits at the very top of EVERY screen: 'Not sharing right now', with a one-line reason and a **Fix it** tap that jumps straight to Settings -> Shared data. The strip never locks the app, and it disappears on its own the moment the phone is sharing again. A phone that is off the cloud still makes and keeps its own local backups.
- If the two phones ever show different data, wait about 30 seconds and pull the page down to refresh, or press Sync now. Each phone keeps its own local copy, so a phone that is not signed in simply will not see the other's changes.

Rule of thumb: keep at least one phone signed in to shared data at all times - that phone is your live copy in the cloud.

8 · The app password lock

You asked for a 4-digit password to keep the app on your phone private. It is a screen lock, not encryption: it stops someone who picks up your phone from reading the orders, but it is not a strong safeguard against someone determined to get in. A fresh phone ships with the standard starting password **8899** already switched on - change it to your own in Settings -> App password (below).

The password lives ONLY on the phone where you set it. It is never sent to the cloud and never shared with the other phone.

1. More -> Settings -> App password. Type a 4-digit password (pick something others will not guess - not your birthday) and press Save password.
 2. Switch on 'Lock the app with a password'. It asks for the password the next time you open the app on that phone - not in the middle of what you are doing.
 3. To turn it off, switch the toggle off. The password stays saved, so turning it back on later needs no re-typing. To change it, type a new password and Save.
- Forgot the password? The PIN itself cannot be recovered (only a scrambled fingerprint of it is stored). No data is lost though: clear the website data for the app on that phone and reopen it; then, with shared data on, sign back in and everything returns from the cloud - or import your last backup file.

9 · Where the app lives & how updates reach you

The app is not from an app store. It is a web page that you saved to your Home screen. The master copy of the code lives on your computer, in a folder called 'jerky'. The copy that everyone opens lives on the internet at your website address - munchies.com.my (the version without 'www'), served free by GitHub Pages. One website holds three pages: the **homepage** at the very front (the advert page people see first), the **storefront** at /store/ (the customer order page), and the **app** at /admin/ (the pages you use every day).

Supabase is a separate, free cloud notebook. The order page writes every new order into it; your app reads from it (that is how a customer's order appears on your phone within ~30 seconds); and customers' live tracking and the 'N left' counts read from it too. Your two phones also use it to stay in sync. This is why those four connection details matter - they point each phone to YOUR notebook. If you never switch the cloud features on, the app still works fine as a single-phone app, and customers can still order by messaging you. This business has its OWN Supabase project - never the bakery's.

Updating the app (when we change the code). Four steps, and only the middle ones are yours:

1. I change the code on the computer (here in our chat). Nothing anyone else sees changes yet.

2. You open GitHub Desktop and press Commit and Push. This uploads the new code.
3. Wait about 10 minutes - the hosting takes a moment to refresh its copy of the pages (this is called the cache).
4. On your phone, FULLY close the app (swipe it away in the app switcher) and reopen it, or pull the page down to refresh. The new version is now there.

Your orders, customers and settings are never lost by an update - they live on your phones and in the cloud, not inside the code, so swapping code never touches them.

- A storefront text change (name, tagline, WhatsApp number, QR, postage fee) does NOT need GitHub at all - typing it in Settings publishes it to customers in seconds. Only code changes - new features, new buttons - need the Commit-and-Push ritual above.
- This manual is NOT part of the website. It lives only in the marketing folder on your computer, so publishing the website never changes this manual, and this manual never changes the website. When we update the manual I simply rebuild this PDF for you.

Seeing an old version? Blame the cache: fully close the app, wait a couple of minutes, and reopen - 10 minutes after a push, everything is fresh.

10 · The rules & small print (pet food from home)

This business sells FOOD - for animals - so it has to be done properly. Because it is pet food rather than food for people, the usual human-food seller rules do not all apply the same way, and the right ones depend on where you are and what you sell. Do not copy the bakery's registrations across - check the pet-food rules separately.

Start by asking the right people, in writing. The main body for animal feed and pet food in Malaysia is the Department of Veterinary Services (DVS / Jabatan Perkhidmatan Veterinar). Ask them (and your local council / PBT for home-based selling) what applies to a home seller of dehydrated pet treats - whether you need any registration, labelling rules, or premises checks for your scale. [VERIFY - requirements change and differ by state.]

Food safety is your reputation. Treat the kitchen like a food business: raw meat stays chilled until use, hands and surfaces are washed between raw handling and packing, batches are dried to a shelf-stable texture, and pouches are sealed and labelled so you know what each one is and when it was made.

- **Labels matter even for small batches:** what the treat is (the animal and the product), the ingredients (every one - animals get allergies and sensitivities too), the date made, a best-before / keep-by, and your name and contact so a customer can reach you.
- **Claims are promises.** Saying 'healthy', 'natural', 'grain-free' or 'good for sensitive stomachs' is marketing you must be able to stand behind - keep claims simple and true, and note when a product is a treat or supplement and not a full meal.

Rules and authorities change. Whenever a rule matters, we verify it together and keep the answer in section 12 before you rely on it.

11 · Quick start - do this week

1. Set up WhatsApp Business (30 min): name, hours, catalog with your pouches.
2. Create the Facebook Page and Instagram business account (30 min).
3. Put the order page link in your Instagram bio and as the Facebook page button.
4. Set up the app once: ingredients, products with recipes, posting days and dates (section 5), the four Supabase details + Live availability and Shared data (sections 6 and 7), your postage fee, and then publish the order page from Settings -> Storefront (section 4).

5. Place a tiny test order on the storefront from your own phone and confirm it in the app, so you have seen the whole loop once.
6. Post one photo on each platform with a short caption and pet-treat hashtags.
7. Reply to every comment and message the same day.
8. Check the pet-food rules with the right authorities (section 10) - book this early, it takes time.

One link, one message, one app, one QR - that is the whole system.

12 · Questions asked so far (the log)

Q: What can be done for a home pet-treat business on WhatsApp, Instagram and Facebook? A: WhatsApp confirms orders and takes payment, Instagram and Facebook bring people in, and the app turns orders into ingredient lists. Set up the free business tools first, then post consistently.

Q: How do customers pay? A: By TNG. The confirmation message carries a TNG QR to scan; they put their phone number in the payment description and send the receipt screenshot back in the same WhatsApp chat. You match the receipt to the order number and then mark the order **Paid**.

Q: How is delivery handled - I thought this business is nationwide post? A: It is. Orders are posted on the posting day they choose (Mon / Wed / Fri) to the postal address they give. Your **flat postage fee** (Settings -> Postage, section 6) is added to the confirmation message for every posted order - the storefront total never includes it, so you confirm the true 'To pay' figure on WhatsApp. A nearby customer can still choose Collect if you offer it.

Q: Why does the app need the customer's WhatsApp number to confirm? A: Pressing **Send confirmation** sends the customer their confirmation message with the order number and payment QR over WhatsApp - no number, no message.

Q: A customer said the order page showed 'Order received!' - is the order already confirmed? A: No. 'Order received!' only means the order reached your app and is sitting in your New Orders inbox. Nothing changes by itself: it stays New until you open it, and the customer only gets their WhatsApp confirmation when YOU press **Send confirmation**. See section 14.

Q: Is the storefront total wrong - it says RM22 but I charge postage? A: Not wrong - the order page never shows your postage fee (by design). When you confirm, your app adds the postage line and shows the real 'To pay' total in the WhatsApp message. The homepage tells customers a flat postage fee applies.

Q: Why does an order show 'Preparing' and not 'Baked'? A: You do not bake - you dehydrate. The middle stage is named **Preparing** (when you dry, pouch and label the order). The journey is New -> Confirmed -> Paid -> Preparing -> Packed -> Delivered.

Q: What is Settings for / where is everything? A: One screen: More -> Settings. Delivery settings (days, cut-off, capacity), App password, Storefront (the order page text), Postage (your flat fee), Website & developer (the site credit + who your wishes go to), Referrals, Mailing labels (post), Live availability + Shared data (the cloud), Backup & safety, and Danger zone. Every card is explained in section 6.

Q: What is the 'What customers say' part of my homepage? A: A section where customers leave reviews (a star rating, a few words in English, Mandarin (Chinese) or Bahasa Malaysia, optional photo). Nothing shows until YOU approve it: More -> Reviews walks through each review one at a time, drawn exactly as it will appear on the homepage (photo, stars, message, name), with the ones waiting for you first - Publish puts one on the homepage, Take down hides it, Delete removes it for good, and every tap moves you on to the next review (it never moves by itself while you decide). Approved reviews then play on the homepage as a swipeable carousel - one at a time, sliding on their own, with arrows and dots to look through them. A green 'N waiting' pill on the Reviews row and a 'new review(s) to publish' card on Home tell you when reviews are sitting on you. Approve first, always.

Q: What are the cloud copies in Settings -> Backup & safety? A: Automatic full snapshots of your records, saved to your own cloud every time you open the app signed in - a Daily copy each day, a Weekly copy on Mondays, a Monthly copy on the 1st (newest 7 / 4 / 3 kept). View peeks inside any one copy read-only - its orders, prices and stock at that time, nothing written. Restore steps your phone back to one (a 'Before restore' copy is saved first); Download saves it as a file; Back up to cloud now makes a Manual copy that stays. Your Export / Import files still work as before.

Q: What is Supabase, and why do I type four connection details? A: Supabase is the free cloud notebook that carries orders between your order page, your app and your two phones. The four details (URL, anon key, app login email, password) point each phone to YOUR notebook. You type them once in Settings, on each phone. See sections 6 and 9.

Q: How do I update the app when we change something? A: You open GitHub Desktop, press Commit and Push, wait about 10 minutes for the hosting to refresh, then fully close the app on your phone and reopen it. Your data is never touched by an update. See section 9.

Q: What is hosting? A: Hosting is simply the home address on the internet where your website lives - yours is GitHub Pages at your own address (once the domain is chosen). The homepage sits at the very front, the app at /admin/, and the storefront at /store/. See section 9.

Q: Where do I add or change the selling units (pouch, pack...)? A: In one place: More -> Units. Add with the 'New unit' card at the top (pick family **Count** - that is the family products sell in), or tap **Edit** on an existing unit to rename it. Only Count-family units appear in the product Unit dropdown. Step-by-step in section 5.

Q: How do I stop customers ordering something too close to posting day - or only in one season? A: Open that product in Products and set its own 'Orders close (days before delivery)' box, or its 'Available for delivery dates' From/To window. Both are per product and optional - empty means any open posting day. See 'Delivery-date rules' in section 5.

Q: Can my homepage reviews show one at a time and move by themselves? And can my whole site be read in Malay or Chinese too? A: Yes to all (Engine v64). Published reviews now play on the homepage as a carousel - one review at a time, sliding on every few seconds, swipeable, with arrows and dots under the section. And the whole homepage and order page can be read in English, Mandarin (Chinese) or Bahasa Malaysia through the language switch at the top (English is the default, and a visitor's choice is remembered next time they visit). A reviewer adds a photo by **Take photo** (their camera) or **Choose photo** (their photo gallery). On your side, each product can carry its own Chinese and Malay name for shoppers (Products -> Edit -> Shop names) - a product with no translated name simply keeps its English name. See sections 4 and 5.

Q: Can my software wish list reach the developer by email, and can the website carry a credit for who built it? A: Yes (Engine v64). Type the developer's name and one or more email addresses under More -> Settings -> **Website & developer** (section 6, card 5), and a small 'Website by [name]' credit appears at the bottom of the homepage and the order page, with the developer under More -> About as a WhatsApp and email link. Prefer WhatsApp? Add the developer's number (digits with country code) in the same card and the developer link opens WhatsApp with a ready 'Hi!' - the email links stay underneath. Add a software wish on the More screen and the FULL wish list - every wish, ticked or not, newest first, with the app version and the date - is emailed to those addresses; an 'Email the full wish list' row on the card can send it by hand any time. See sections 5 and 6.

Keep asking. Every question you ask is folded in here and this guide is rebuilt - so nothing gets lost when a chat is compressed.

13 · Failure-mode analysis - the 'N left' problem & the fixes made

This section records a real weakness (found in the bakery that this system was built from, September 2026) so we never have to rediscover it or re-do the fixes here. **The problem (failure mode):** the 'N left' / 'Sold out' numbers are recalculated only by the app, and the app runs only on our phones. When both phones were asleep - overnight - a customer could order against a count that was slightly too high, which could quietly oversell a limited product. The order itself was never lost, but the count could lag behind real orders. **The fixes we have already made (all live):**

- **The order page watches its own counts (done).** If something a customer chose sells out, or drops below the number they asked for, while they are still ordering, the page fixes the cart by itself - it removes that item or lowers their quantity to what is actually left - and shows a small note above the menu.
- **The database itself now drops the count the instant an order lands (the big fix).** We installed a rule in Supabase. The moment a customer places an order, the matching day's slots and that product's 'Only N left' go down by what they ordered - even with both phones fully asleep. A value pack draws from its single's daily pool instead of holding its own count (section 5). The rule lives as the script `supabase/shared_pool_slots.sql`, which replaces the older `instant_slots.sql`. Both scripts are safe to re-run, so if the database is ever recreated, run `shared_pool_slots.sql` once and the counts are back.
- **The app refreshes only while it is on screen (done).** It does no background work when the phone is locked, to save battery - and it still refreshes the instant you come back to it.
- **The app's full recalc always wins (by design).** Every time the app opens it re-publishes the true count from scratch, so the automatic rule and the app can never fight or double-count.
- **Orders are never lost.** An order is written to the cloud the moment it is placed. It sits in New Orders until you handle it, no matter how the counts move in the meantime.

Memory rule: the database watches the numbers overnight; the order page guards the last seconds of a customer's order; the app's fresh recalc is the referee that keeps them in agreement.

14 · Failure-mode analysis: the 'isn't on WhatsApp' glitch & the fixes made

This section records a real glitch (from the bakery system, September 2026) so we never repeat it. **What the customer saw:** she filled the order page and pressed Place order. Instead of a clean confirmation, WhatsApp popped open and answered 'The phone number +60123456789 isn't on WhatsApp'. She cancelled. Then the page showed 'Order received!'. Two separate worries hid in that one moment - a stale number, and a message that looked like the maker had already confirmed.

- **The root cause.** The page used to open WhatsApp on every successful order, with a copy of the order for the customer to send the maker. The number it dialled came from the storefront settings, which at that time still held the OLD test number. No real person was behind that number - it was a leftover, waiting to be replaced with the real one.
- **Fix 1 - WhatsApp no longer pops open on a successful order.** An order that reaches the app now just shows the green 'Order received!' card. WhatsApp opens ONLY as a safety net when the order somehow cannot reach the app, so an order is never lost in silence.
- **Fix 2 - 'Order received!' is not a confirmation.** It only means 'in with the maker'. The order lands in your New Orders inbox and stays **New** until YOU handle it. Confirming is always a human tap by you.
- **Fix 3 - the storefront always shows the LATEST saved details, nothing pre-printed.** The name, WhatsApp number, tagline and TNG QR that customers see are read fresh from the cloud. The one thing that was still old that day was the number sitting in the app's settings - it was the test number. The fix you make yourself: More -> Settings -> Storefront -> WhatsApp number, type your real number (digits only,

country code first, so 012-345 6789 becomes 60123456789) and it saves.

Memory rule: 'Order received!' = the business has it, NOT 'it's confirmed'. Confirmed is always a human tap by you. And the WhatsApp number on the order page is always whatever the latest saved Storefront settings say - so keep your real number saved there.

15 · Order alerts - your phone pings when an order lands

When a customer places an order on the order page, your phone can ping within a few seconds - even while the app is closed, the phone is locked, or no computer is switched on. The ping comes from the cloud at the moment the order arrives, not from any device you own. (This is a separate, optional extra - it uses the free 'ntfy' app, not Supabase.)

What the ping looks like. A notification from the 'ntfy' app that reads 'New order', with the customer's name and WhatsApp number, the items and quantities, the posting date, the total, and any note or address.

- **This ping is for YOU only.** The customer sees nothing new. And orders you add yourself in the app do not ping anyone; only orders placed by customers on the order page do.
- **What the phone needs.** The free 'ntfy' app (App Store or Play Store). No account, no password - you just subscribe to YOUR OWN private channel for THIS business. It works on Wi-Fi or phone data, and the phone can be asleep.

Setting up a phone (do this once on EACH phone you want to ping):

1. Install the free 'ntfy' app from your phone's app store.
 2. Open ntfy and tap the + (subscribe / add) button.
 3. In the Topic box, type exactly the topic I give you for THIS business when we set it up - it looks like 'furkidz-orders-<random letters>'. Leave the Server as the default (ntfy.sh). Do NOT reuse the topic from the bakery - each business gets its own.
 4. Tap Subscribe (or Done). When the phone asks to allow notifications, tap **Allow**. That is all.
- **Adding a helper's phone (or any phone you trust).** Repeat the same four steps on that phone with the SAME topic. Every customer order then pings BOTH phones at the same moment.
 - **To silence one phone later:** in the ntfy app, delete that topic, or just turn the app's notifications off on that phone.
 - **Keep the topic name private.** It works like a password: anyone who knows it can read your order notifications. Keep it to the phones you set up - never paste it into a public post, a customer message or a shared link.

Test it any time: place a tiny test order on the order page from one phone and you should feel the ping within seconds on every phone you set up. Then mark that order Delivered in the app so your records stay clean.

16 · Promotions & social media - your marketing playbook

This section holds the offer ideas and the social rhythm that fit a one-person, made-to-order pet-treat business. You are new to marketing - that is exactly why this is a menu you choose from, not a list you must do all at once. Start with ONE idea, run it for two or three weeks, then add the next. Whatever you offer, always say the deadline plainly - 'Order by Sunday 8pm' beats a clever sentence.

The offers:

- **P1 - The early-bird window (your strongest tool).** You are made to order, and each product already carries an 'Orders close (days before delivery)' box (section 5). That deadline IS the promotion: publish the next batch list a few days early and talk about the cut-off - 'Friday's batch closes Thursday 6pm - order

early to lock yours in.' Early orders are pure gold for you: you know the batch size days ahead and never over- or under-make.

- **P2 - The weekend plan-ahead window.** Most people browse and chat on weekends - invite it: 'Order over the weekend and your order earns a free mini chew.' You get your numbers before the week starts; the customer feels looked after.
- **P3 - The weekly menu drop.** Post next week's list on the same day and time every single week - say Sunday 8pm - with the list, the prices and the cut-off. Customers learn the appointment and stop asking what is available. Your order page does the rest.
- **P4 - Combo bundles.** Your products sell as pouches - raise the average order by pairing them: 'chicken + duck = the variety pack', 'any order over RM40 gets a free mini chew', or a mixed sampler box (a product made from other products, section 5).
- **P5 - First-few-of-the-drop flash.** 'The first 8 orders for Friday each get a free mini chew.' A small extra for the earliest orders pulls orders in on announcement day instead of the day before posting, so your numbers lock early.
- **P6 - Bring-a-friend (the app's referral program).** Word of mouth sells a home business better than any ad, and the app runs it for you - see section 18. Share it as: 'Share your link, your friend gets RM off their first order - and you earn a credit for every friend who orders.'
- **P7 - Seasonal treats.** Around festivals - CNY, Raya, Christmas - add a special item with a From/To delivery window (section 5), so the order page tells customers it is only available up to a fixed date. Announce it one to two weeks early and post a 'closing soon' reminder in the last few days.

The social rhythm - you only need a small, steady presence. The job of social media here is one thing: remind people the batch list is live, and build trust in the quality. Three posts a week is plenty for a solo maker.

- **S1 - A simple weekly rhythm.** Pick three moments and repeat them: (1) the menu drop (P3) - a photo of the week's treats with prices and the deadline; (2) a midweek 'drying in progress' - trays of chicken or sweet potato in the dehydrator, fresh ingredients; (3) posting day - the packed parcel or a happy customer's pet photo. Shoot all the photos on ONE make-day and spread them out - one session feeds the whole week.
- **S2 - Deadline and 'left' reminders - your strongest posts.** A screenshot of your own order page - 'Friday batch: 3 left, closes tonight 6pm' - is honest scarcity and always true. Post one the evening before each cut-off.
- **S3 - What to film (a content bank).** Short clips under 20 seconds, no talking needed: chicken breast sliced thin, the dehydrator trays going in, a pouch being filled and sealed, 'what's in the parcel' while you pack, a pet happily chewing. Close-up shots sell treats better than words - save your good ones and reuse them on quiet weeks.
- **S4 - Where to post.** Start with Instagram and Facebook. Put your area on posts and use pet-treat hashtags - #PetTreatsMY, #DogTreatsMY, #HomemadePetTreats, #HealthyPetSnacks - so local people can find you. Join local pet groups and answer questions helpfully, never pushily. And never forget the channel you already own: WhatsApp Business Status and its catalogue reach the people who have already bought from you once.

The solo-maker rule: never promise more than you can make. If a promotion fills up fast, that is a good problem - reply 'batch full, next one Friday' and let scarcity work for you. Only run offers you can keep happily on a busy week. And whenever we change an offer, we update it here when the guide is next rebuilt, so the manual never lies to you.

17 · Daily & weekly routine - message of the day + weekly report

This section is for you alone - the morning check-in and the weekly look-back that keep a one-person business on track. Your Home tab now does part of the look-back for you: the 'This week' numbers (orders, roughly RM, top sellers) and a tick-off weekly to-do list. The to-do starts as your usual jobs, and it is yours to shape: tick a job as you do it, tap the small pencil to reword any line, tap the x to remove one, or type your own job into the Add box. Your edited list is what comes back every week, and when your phones share data (section 7) the same list and the same ticks appear on both. Weeks start on **Sunday**: the to-do resets every Sunday and 'This week' counts orders placed since Sunday.

- **Your message of the day (read every morning, fill the blanks).** 'Good morning - today is [day], [date].

1. Any new orders waiting? Check the New Orders inbox and WhatsApp first; anyone who ordered gets a reply before you start. 2. Today's make: [your list from the app]. If today is nearly full, post a quick 'nearly full' status. 3. Any order cut-off today? [which products close] - one reminder tonight if the batch still has room. 4. Postings and pickups: [what is going out and when - and stick a label on each parcel]. 5. Today's one extra job: [one thing only - packaging, a promo post, a new recipe test]. And breathe - one batch at a time.'

Your weekly report (fill every Sunday - it takes five minutes). Write in a notebook or a note on your phone:

Week of ____ to ____
Orders this week: ____
RM taken (roughly): ____
Top sellers: 1) ____ 2) ____ 3) ____
Sold out (make more next time): ____
Did NOT sell (weekend special or drop it): ____
WhatsApp messages / questions: ____
Promo run this week: ____
One thing to do better next week: ____

- **Where the numbers live.** Your Home tab works the weekly numbers out for you: 'This week' is every order placed since this week's Sunday (the week runs Sunday to Saturday) and its value (products with no sell price are left out of the RM), with the top three sellers. If you want the exact RM taken, cross-check your WhatsApp payment receipts. The point is the pattern: make more of what sold out, clear what did not, and repeat the promo that worked.

- **Which number is which - 'This week' vs 'Coming 4 weeks'.** They answer two different questions, so the figures will not match, and that is normal. 'This week' counts orders by WHEN THEY WERE PLACED - your intake and your money coming in. 'Coming 4 weeks' counts pouches and RM by WHEN THEY POST, whatever day they ordered - the batch you have already promised.

Two habits beat any amount of planning: the morning read keeps you calm on busy days, and the weekly report tells you what customers actually want. Five minutes each, and your batches stop being guesses.

18 · Bring-a-friend - the personal link, the credits, and the follow-up

This is the app's referral program: a customer shares a personal link, a friend who is NEW to you orders through it and gets money off their FIRST order, and the customer earns a credit to spend later - one credit per NEW friend (a friend who comes back a second time does not earn again). The app keeps the numbers and the list of credits; YOU still apply the real discount yourself when you confirm an order on WhatsApp. Nothing is promised on the public order page - the app only reminds you who to thank and how much to take off.

- **Where the numbers live.** More -> Settings -> the 'Referrals (bring-a-friend)' card (section 6, card 6): the switch turns the whole thing on and off, and three boxes set the deal - the friend's first-order discount in RM, the credit a referrer earns in RM, and how many days each credit stays valid (blank for 'never expires'). As you start it is RM3 friend / RM3 referrer / 90 days. The amounts and validity sync across your phones, so both phones always quote the same deal.
- **The share message (what YOU send to ask for referrals).** On the Customers tab, open any customer who has a WhatsApp number and you find a 'Bring-a-friend' box. **Copy share message** copies a ready WhatsApp text with that customer's personal link already inside - paste it and send. Each customer has their own link, built from their WhatsApp number, so when a friend orders through it the app knows who sent them.
- **The follow-up message (your warm check-in after a delivery).** The same box has **Copy follow-up** - a warmer message that asks how the treats went first, then slides the referral in: 'How did the {Chicken Jerky} go?... A friend who is NEW to us gets RM off their first order, and you get RM off a future order for every friend who orders through your link.' You can teach it how to feed the treat: on each product (Products -> Edit) there is a **Feeding tip** box - type one line like 'Tear into small pieces for small dogs' and that tip appears in that product's follow-up.
- **What a friend sees.** The link opens your normal order page with a small green note near the top - 'You were referred - you have a welcome discount on your first order'. No amount is shown, so it never promises more than you set.
- **In your app - what you do when a referred order arrives.** The order lands in the New Orders inbox tagged 'referred', and under its status map you see what to do. For a brand-new number: 'New referred customer' with **Give credit** (adds the friend's discount + the referrer's credit in one tap) and **Skip - already a customer**. If someone ordered through their OWN link, the app just says so - no credit. Whenever an order's customer has an unused credit ready, you'll see **Apply credit (N)** - tap it once you have actually taken that RM off in WhatsApp, so your records match reality.
- **Managing credits on a customer.** Open the customer and the 'Credits' list shows every credit with its state - **valid** (green), **used**, or **expired** - and when it runs out. Each valid credit has **Mark used** and **Expiry**. Any credit can be **Removed**. **Add credit** lets you record one by hand - for a friend you met in person who came without a link. Credits sync across your phones within ~30 seconds, and nothing here ever changes an order or a price.

Run it as a gentle habit, not a hard sell: after a delivery, send the follow-up to a happy customer - 'did your pet enjoy it? if yes, here's your link'. Happy customers send it happily, and you only ever give a credit when a NEW friend actually orders.

19 · Pouch pricing study - the meat cost, the drying yield and the price

A working study of how to price a pouch of dehydrated treats, using the practice products as the example (recorded 7 Sep 2026). The numbers below are the SAMPLE figures the app comes with - replace them with your real ones before you go live, and this chapter is rebuilt. The method is what matters, and the two honest unknowns are marked [MEASURE].

- **The practice products and their typed recipes (from 'Load sample data'):** Chicken Jerky sells at RM 22 / pouch, recipe 160 g chicken breast + 2 g salt; Duck Jerky RM 24 / pouch, recipe 160 g duck breast + 2 g salt; Sweet Potato Chews RM 15 / pouch, recipe 200 g sweet potato. The ingredient prices behind them: chicken breast RM 13 / kg (wet market), duck breast RM 26 / kg (online), sweet potato RM 8 / kg. So the ingredient cost per pouch the app works out is: chicken ~RM 2.09, duck ~RM 4.17, sweet potato ~RM 1.60.
- **The catch - water is heavy, and it leaves.** Dehydrating pulls water out: a raw chicken breast is roughly two-thirds water, so 160 g of raw meat dries down to somewhere around 50-60 g of jerky. The typed recipe says 'per pouch', but what actually fits in your 100 g pouch depends on how much water YOUR batch

loses, which depends on thickness and drying time. **So the single most important number to measure is the drying yield:** weigh the raw meat that goes in and the finished jerky that comes out, and write down the ratio. Until you measure it, the pouch cost above is the cost of the RAW recipe, not necessarily of one full pouch. [MEASURE]

1. Weigh a batch: 1,000 g raw chicken breast in, how many grams of jerky out? (Expect roughly 350-450 g - the exact figure is your yield.)

2. Weigh ONE finished pouch of jerky. If a 100 g pouch of finished jerky needs ~250 g of raw meat at a 40% yield, then the real meat cost per pouch is ~RM 3.25 (at RM 13 / kg), not the RM 2.09 the raw recipe suggests. That difference is exactly what the yield number corrects.

- **Costs that are easy to forget.** Meat is only part of the pouch. Count in: the electricity of the dehydrator run, the pouch + label + a silica sachet, and the parcel + postage you charge separately (your flat fee). And your time. A clean way to see it: 'ingredient cost per pouch + packaging + electricity = your make cost'; the price sits well above that; the postage fee covers the post and box.

- **Price ladders from the practice numbers.** Even before the yield correction, the ingredient share is small: chicken ~RM 2.09 against a RM 22 sell price (under 10%), duck ~17%, sweet potato ~11% - which looks very healthy, but it is ONLY the meat. Once you add packaging, electricity and your time, the honest margins come down, and dehydrating is slow - a dehydrator makes a limited kg per run - so 'how much can one run actually make' sets how low you can price. [MEASURE]

- **The pricing rule that decides it:** if orders keep selling out before your cut-off at the current price, the price can go up (test +RM2-3); if you are NOT selling out, the price is probably not the problem - the photos, the reach or the trust are, and a cheaper price will not fix demand.

- **Cheapest tests to run this week, and their answers belong back in this chapter:**

1. Measure the drying yield for chicken, duck and sweet potato (one batch each) and write the real grams here.

2. Fill one real pouch and weigh the finished jerky that goes in - confirm how many pouches one recipe makes.

3. Add up a pouch's real make cost: meat (corrected by the yield) + pouch + label + silica + the dehydrator run.

4. Price with the rule above: keep, raise or fix the price based on whether batches sell out.

This chapter is a record of the thinking, not a promise - it is a first draft while the products and prices are still being decided. Whenever a test changes a decision, we update it here when the guide is next rebuilt.
