

Munchies Furkidz - change history

Every version of the backoffice app, from v54 to v88 - newest first. The green 'Engine v###' pill on the More screen tells you which build a phone is running.

About this history: it honestly begins at version 54, when the two-phone shared-cloud era started (2 September 2026). The app grew through earlier versions before that, but they were never written down version by version, so they are left out rather than invented.

What changed in each version of the backoffice app, newest first. Each version number is the "Engine" you can see on the app's **More** screen, so you can always tell which build a phone is running.

14 Sep 2026 - engine v88 (no database setup needed). The holiday tint sits on the dates at Orders, and a mouse resting on a marked day names it. Two small things, both about the Orders screen and the bubble.

The tint now sits on the line of dates. On the Orders calendar each posting day carries its booking count, and that count sat *under* the date number, which pushed the number 5.5px above the middle of its row. The occasion wash is centred on the row, so on this one screen the tint sat lower than the numbers it was meant to be washing - and the dates themselves did not line up with each other. The count now sits at the foot of the day, every date number sits on one line, and the tint runs through that line. Nothing else about the calendar moved: the green ring, the chosen day's fill, and the counts all read exactly as before.

On a computer the name comes up on hover. v87's bubble needed a tap. With a mouse, resting the pointer on a marked day now shows its name on its own, exactly as the customer's page does. This is deliberately only for a pointer that can hover: a phone keeps the tap, so a finger sweeping a run of days across the Availability or Delivery Dates calendars never drags a bubble along with it.

14 Sep 2026 - engine v87 (no database setup needed). Tap a marked day and it tells you its name - on every calendar in the app. v85 drew your marks on all five of the app's month calendars, but only as colour: a wash and a band, with nothing to say which holiday it was. The customer's own page has answered this since its calendar arrived - tap a marked day and a small dark bubble above it says the name - so the app now does the same thing, with the same look.

A tap names the day and still does that day's usual job. The bubble appears above the day ("Malaysia Day") and goes away as soon as you tap anywhere else. Nothing else about the tap changed: on the Orders calendar it still opens the day, on a product's Availability calendar it still marks or unmarks the sell day, on Delivery Dates it still starts the range you are about to mark. A day that sits inside two marks takes the name of the shorter one - the same rule the colours already follow, so the name and the colour always belong to the same mark. A day already gone is never named, because no mark is drawn on a past day either.

Two kinds of day could not be read at all before, and now can. On the Orders calendar a marked day you do not post for was a quiet number with nothing to tap, and on the Delivery Dates calendar a marked day that is *already* one of your posting dates could not be tapped either - its tick is removed from the list below the calendar, never by tapping its square, so its tap was free. Both now say their name when tapped, and nothing else about them moved: a Delivery Dates square still never ticks or unticks a date.

The Order date boxes name their day above the date, not above a day of the month. Those two fields fold their calendar the moment a day is picked, so a bubble drawn on the day would vanish with it. The name sits above the date the box is showing instead, which also means an order recorded on a public holiday says so for as long as that date is on the field.

Nothing was added, moved or removed, and the shop is not touched: this is the same bubble the shop's calendar has been showing, arriving on your own calendars.

14 Sep 2026 - engine v86 (no database setup needed). On the Orders screen your marked days now sit

on their days, at the same depth as everywhere else. v85 put your marks on every calendar in the app. On the Orders screen the wash did not line up with the days underneath it. Two things were behind that, and both came from the same fact: the days on that one screen are taller than the days anywhere else, because a posting day there carries its booking count ("3/12") under its number.

A holiday band was stretched to fill its week row. Where every day is the app's usual height, a band came out the same depth a single-day box is, so the two shapes matched - which is how the rest of the app has always drawn them. On the Orders screen the rows are taller, so the band there came out deeper than a single-day box, and deeper in the weeks that held a posting day than in the weeks that did not, so one holiday's own band changed depth from row to row inside the same month. **A band is now a sheet of one depth, centred on its row** - the same depth a single-day box has, on every calendar, whatever height the days around it happen to be.

A plain day kept the app's usual height inside a taller row, so it sat at the top of the row rather than on its middle. A single-day mark was therefore drawn 6px higher on a day you do not post for than on a day you do: the same holiday, on a different line, decided by whether you post that day. **Every day of the Orders month is now drawn at one height,** posting day or not, so a mark sits on the same line as the day it covers, beside the booking counts.

One more thing fell out of that. Today's soft glow is drawn around a whole day on the app's shorter calendars, and around a taller day it would have become a box again - the very thing that glow replaced. **Today on the Orders screen now glows around its number,** the same round glow a posting day's number carries, so today reads the same whether or not you post that day.

Nothing else changed. The shop's calendar and your Delivery Dates calendar look exactly as before (their days are all one height, so they never had this), and no mark was added, moved or removed: this is the drawing only.

14 Sep 2026 - engine v85 (no database setup needed). Your marked days are now drawn on every calendar in the app, not just the one you marked them on. Until now a holiday only appeared on the customer's calendar and on the Delivery Dates screen you marked it on. Every other calendar in the app drew a plain month: the month calendar at the top of the Orders screen, the little **Order date** calendars in the new-order form and in the Edit-order pop-up, the posting-day picker inside that pop-up, and a product's **Availability** calendar where you mark the days it sells. So a holiday you were planning around was invisible on every screen you actually plan on.

Now all of them draw your marks, in the same two shapes and the same colours as the Delivery Dates calendar - a see-through band across a run of days, deeper the shorter the run, and a box for a single day. A mark on a day you do not post for is drawn too, on a dimmed day, since that is the only way a holiday on a quiet day can be seen at all. Nothing about the marks themselves changed: they are still only ever something to see, and a mark still never adds or removes a posting day or changes what a product sells. Two small pieces of the drawing were tidied while moving it: the green tint on a day a product sells is now a see-through wash rather than a flat fill, so a holiday band running behind it still shows through instead of the mark disappearing on exactly the days you sell (the tint itself looks the same as before); and a marked day that happens to be today now keeps the soft glow that says "this is today", the way the shop's calendar has always drawn it.

14 Sep 2026 - engine v84 (no database setup needed). A day you marked is now the same gentle wash everywhere, whichever calendar you are looking at. A marked day was drawn one of two ways, decided by a single question: is this a day you post for? On a day you post for the mark went pale, so the green "you can order" ring stayed the first thing the eye read. On a day you do not, the mark was drawn at full colour, as a solid block with the number turned white. September's Malaysia Day sat on a posting day and read as a quiet tint; October's World Animal Day fell past the posting days published so far and read as a loud solid block - so the same kind of holiday looked like two different things, and a mark quietly changed its own appearance as the posting window moved towards it.

Now a mark is only ever a see-through wash of its own colour, and its depth follows how long the mark runs: a one-day holiday the deepest, a long school break the palest. The customer's calendar and your own

Delivery Dates calendar read that depth from the same place, so a day wears exactly the same mark on both sides of the shop and in every month. Nothing is ever a solid block of colour any more, which also means the date number and the green posting pill always read on top of a mark, whether or not you post that day. Only the look changed: marking, removing, renaming and loading standard occasions all work exactly as before, and a mark still never adds or removes a posting day.

14 Sep 2026 - engine v83 (no database setup needed). Marking a holiday now tells the shop straight away. A day you mark on the Delivery Dates calendar is drawn on the customer's own calendar (engine v79 to v81). But saving a mark only ever sent your posting days to the cloud - it never sent the customer's page anything - so the marks reached the shop only by accident, whenever you next happened to save a product or a setting. Mark the holiday, open the shop, and nothing had changed. Found while you were looking for a holiday on the shop and finding none.

Now the same save does both. Marking a day, removing a mark, loading a set from the standard list, or renaming or recolouring one all republish the customer's page within a couple of seconds, exactly the way editing a product does. Nothing else about a mark changed: it is still only ever something to see while planning, it still never adds or removes a posting day, and a name you typed yourself still never leaves your phone.

One tap to catch up the marks you already have. The fix sends the marks from now on; the ones already on your calendar have never been sent at all, so open More -> Settings -> Storefront and tap **Publish now** once. After that the shop's calendar follows your marks by itself. Nothing to run in Supabase.

14 Sep 2026 - engine v82 (no database setup needed). A product's selling days are now marked on a little calendar inside the product's own screen - weekend, certain days, a season, or any mix of them. Until today a product could say only two things about *when*: a notice period, and one from-date and to-date for a season. You asked to set it freely instead, so the two date boxes have become a card you mark.

Open a product and tap the Availability card. It sits under Daily limit and stays folded until you tap its title, exactly like the product-text card you already know. Folded, its title tells you what is marked - "Every day", or "Sat & Sun", or "1-24 Dec 2026" - so the Products screen alone tells you a product's selling days without opening anything.

Inside, it is a month calendar and four gestures. Tap a weekday letter (M, T, W...) and every one of that weekday **in the month shown** is marked: tap S twice and the product sells on Saturdays and Sundays. Tap one day to mark just that day. Slide your finger across several days and the whole run is marked. Tapping or sliding over a day that is already marked takes it back. Everything you mark is added together - mark Saturday and Sunday, then a week in the middle, and the product sells on all of them.

Nothing carries over into the next month, which is the point of it: marks belong to the days you marked and no others, so a December-only set stays December-only and January starts with nothing marked. Page to another month with the arrows and mark that one too if you want to sell then. And a product whose card you have never opened sells on every posting day exactly as before, so nothing on your live shop moves until you mark it.

A period that crosses a month or a year is one mark with two ends you can stretch. The card lists your marks under the calendar; tap one and its **Starts** and **Ends** dates appear above it, and you can push either end as far as you like - a Sat & Sun run from 1 Dec to 4 Jan is one line, not two marks. Leave an end empty and the mark simply has no bound on that side ("from here on", or "up to here"). Type the two dates the wrong way round and they are put in order for you. A small x on a listed mark removes it whole.

On the order page, a day a product is not sold for is not a note - the product is simply not there. No card, nothing to want and not have. If a customer already had it in their basket and then switches to a day it is not sold for, it leaves the basket and a short line says why. The one rule that keeps its note is the notice period: a product needing 14 days IS sold that day, it only has to be ordered earlier, so it stays on the menu reading "Orders close 14 days before the posting day - pick a later date" - the two are different questions, and only the second one hides anything.

Two things worth saying plainly. The old From/To season boxes are gone; a product that had them opens

with that period already sitting in the card as one mark, so nothing you set before is lost. And a product whose selling days have all gone by keeps them, on purpose: your own rule is "if I have not indicated a selling date, it is not selling", so a mark you leave on says exactly that, and the way to put a product back on sale every day is to take its marks off with the x. No database setup, and posting days, capacity, value packs, ingredients, suppliers and everything else are untouched.

14 Sep 2026 - engine v81 (no database setup needed). A holiday you marked is now drawn on the shop's calendar exactly the way your own calendar draws it: a pale band across a run of days, a solid box for a single day. The marks were already reaching the shop; it was only their shape that differed, and a mark that looks different on the customer's page than on yours is a mark your customer has to learn twice.

On the shop, a marked day now wears the mark your own calendar gives it. The shop had been drawing each marked day as its own flat pale square, so a holiday running over a week read as a row of separate blocks where your own calendar shows one continuous shape. Now a holiday running over **several days** is a **pale see-through band** across those days - one unbroken rounded band per week row it crosses, in its own colour, and **deeper the shorter the run**, so a one-day holiday still stands out inside a long school break. A **single-day** holiday is a **solid box** in its full colour on its one day, a touch narrower than the band so a longer band still peeks out at its sides. The eight colours are your own calendar's eight, and the strength steps are the same three, so a marked day reads the same to your customer as it does to you.

The one place it gives way: a day you post for. Green is the colour the posting ring uses, and a solid box would swallow that ring - so on a day you post for, the day a customer can actually order, the box goes pale there and the **green ring stays the first thing the eye reads**. The mark is still there on that day, and the day is still named on a tap. This is the one guard on the shop's calendar, and it covers every mark colour rather than green alone, so no colour can ever hide the days that can be ordered for.

Nothing else moves. Tap a marked day - or, on a computer, rest the mouse pointer on it - and the same small bubble names it, e.g. "Malaysia Day"; tapping anywhere else puts the bubble away, and still nothing is listed under the grid. Today still breathes its soft glow. A run still stops at today rather than colouring days already gone, exactly as your own calendar leaves past days alone. And your own typed-in days still never reach the shop: only a day that is, by name and date, one of the built-in standard days can be published, exactly as before. No SQL, no schema change. The calendar the shop draws with is still a copy of your app's own, and a test now pins the two copies' mark rules together as well as their month grids, so a day can never again look like one thing here and something else there.

14 Sep 2026 - engine v80 (no database setup needed). Today glows instead of wearing a box, a holiday you marked is a soft tint you can tap to name, and the Orders screen's sideways date strip becomes the same month calendar the shop shows. Three small things, all pulling the same way: a calendar should read the same on both sides of the shop, and nothing drawn on it should look like something it is not.

On the shop, today no longer wears a little red rectangle. It always meant to be a ring around the date, but on a day you do not post for the app had no circle to draw that ring on, so it traced the day's number as a box instead - which is why it looked like a red square on the quiet days and only looked right on the days you post for. Today is now a **gentle glow** that breathes around the number, with no box at all, and it sits happily on a day you post for too: the **green ring** says you can order for this day, the soft brown glow says it is today. Under **prefers-reduced-motion** (a phone set to calm its animations) the glow holds steady instead of pulsing, so it is still there to find. The same fix reaches the app: the today marker on the Delivery Dates calendar, and inside every date picker, was a hard outline and is now the same soft glow.

A holiday you marked is now a soft wash, and its name comes out on a tap. The shop's calendar used to mark a standard day with a small coloured dot and then list the month's names in a "Holidays" line under the grid - which crowded the very line that line was there to keep clear, and made a holiday compete with the days a customer can actually order for. A marked day now wears a **pale wash** of its own colour over the whole day. The wash is deliberately neither a ring nor a filled dot, because a ring is what "you can order for this day" looks like, and the two must never be read for each other. Tap a tinted day - or, on a computer, rest the mouse pointer on it - and a small dark **bubble** above it names the day, e.g. "Malaysia Day". Tapping anywhere else puts the

bubble away. The "Holidays" line under the grid is gone. Your own typed-in days still never reach the shop: only a day that is, by name and date, one of the built-in standard days can be published, exactly as before.

In the app the same holiday is named **beside the day** instead of in a list: open a posting day and, if it carries a mark, its name sits under the date in the mark's own colour. Nothing at all is drawn on a day you have not marked.

The Orders screen's date strip is now a month calendar. The row of date chips at the top of Orders grew a little longer every week. It is now the same **month calendar** the customer sees - one month at a time, with left and right arrow buttons either side of the month's name. The days you post for are ringed in **green**, and under each one is **how booked it is**: the same "3/12" the Home dials show, or **FULL** when the day has no room left. A day whose orders have already closed shows its count in **red**; a day already gone is dimmed but still opens, because you backfill and look back at old days. Every other day of the month is plain and cannot be tapped. Tap a green day and the app's view moves to it - that day is filled in on the calendar and its orders appear below - and tapping a day in the list below moves the calendar with it, so the two always agree. The arrows reach only the months your posting days fall in, so paging never strands you on an empty month.

The + New order card arrives folded, and leads with the calendar. It used to sit open on every posting day, which is not what that screen is for day to day. It now starts **shut**, showing just its title, "+ New order" - tap the title to open it, and tap the title again (or tap anywhere else on the screen) to fold it away. Opened, it reads in the order you think in: **the month calendar first**, the same one the shop shows, already sitting on the day you are looking at, so tapping another green day moves the whole screen before you have typed anything; **then the customer's details** - name, WhatsApp number, post or collect, a note; **then the items**, with "+ Add another item" and "+ Add order" at the end. It stays open after you add an order, so you can type the next one straight away, and coming back to the screen later starts it folded again.

The Edit pop-up now reads the same way. Its **Delivery day** control was a button you had to tap to reveal a calendar; the calendar is simply there now, already open on the order's current day. The pop-up then reads the day, then the customer's details, then the items - the same order as the card. Every day still to come is tappable, plus the order's own day even if it has passed, so an old order always shows where it is, and the soft notes re-read underneath the moment you pick a different day. Moving an order is unchanged in every way that matters: still one posting day per order, and capacity, the confirmation and the payment reminder, the track page and the WhatsApp messages are all exactly as they were. The button-style day picker the app used in these two places has been deleted along with its tests, because nothing calls it any more.

14 Sep 2026 - engine v79 (no database setup needed). The customer picks a posting day on a calendar, and so do you in the app. The shop used to show its posting days as a row of date chips laid out sideways. Now, under **Pick a posting day**, the customer sees a **month calendar** - one month at a time, with the arrow buttons either side of the month's name to look ahead or back. The days you are taking orders for are picked out in **green**; every other day of the month is plain and cannot be tapped. They tap a green day, and the day they chose is written out in words just underneath - **"Your posting day: Wed, 16 Sep"**. That is the one line of text below the calendar, exactly as asked: no dates floating outside the grid, and still **one posting day per order**. The first open day is already chosen for them when the page opens, so ordering can never be blocked by forgetting to tap. Nothing else about taking orders changed: a day you have cut off is still not shown at all, and a day that is full still greys out with a red **Sold out** badge and cannot be tapped.

Only the standard days you have marked reach the customer. If you have loaded days from the built-in list onto your own Delivery Dates calendar, those days now wear a small coloured dot on the customer's calendar, and a short **Holidays** line under the grid names the month's ones (e.g. "16 Sep · Malaysia Day"). They follow the colour you gave them. A day **you typed yourself** - a birthday, a promo, a school break - never appears: only a day that is, by name and date, one of the built-in standard days can be published, so your own notes stay private to your phone. Mark nothing in the app and the shop's calendar simply carries no dots and no caption.

In the app, the same little calendar now stands wherever you name a date. Three places changed. In the **Edit** pop-up, **Delivery day** is no longer a drop-down list: it names the order's current day, and tapping it opens a small month calendar beneath it - every day still to come is tappable, plus the order's own day even if it has

passed, so an old order always shows where it is. The **Order date** box in that pop-up is a calendar too, with a **Today** shortcut for an order you are typing in right now. And the **+ New order** card has gained a **Delivery day** picker at its top: tap another green day and the whole screen moves to that day, so the product list you are choosing from is always the one that is actually sellable for the day you picked. The soft notes that help you decide - the change/cancel window, a warning, a closed day, too little left - all still sit under the calendar, and none of them stop you.

The calendar expands in place under the button rather than opening in its own window, because the app's pop-ups share one layer and a calendar opened inside one would wipe out the Edit pop-up it was opened from; expanding in place also reads better on a phone. No database setup needed - nothing about how orders are stored, counted, bought for or messaged changed.

14 Sep 2026 - tapping a New Orders row now takes you all the way to the order (no new engine; the phones did not change). Tapping a row in the **New Orders** inbox opened that order's delivery date and stopped there. On a day holding a long list that is as good as landing on the wrong order: you then had to scan down the list to find the very order you had just tapped, and could easily open a neighbour instead. A tap now **scrolls the order to the middle of the screen and flashes it**, and it clears any status filter on the way so a narrowed list cannot hide it. The inbox's own hint line now reads "Tap a row to jump to that order on its delivery date and confirm it." Finding an order with the search box already did this - the two now share the same reveal.

14 Sep 2026 - the TNG QR is a WhatsApp payment code, and Settings now says so (no new engine; the phones did not change). The box in **Settings -> Storefront** that holds your TNG QR image link promised it was "shown on the customer's track page". It never was - and it should not be. Your QR reaches the customer **inside the WhatsApp confirmation and the payment reminder**, and your order page has always told customers you send it over WhatsApp; nothing on the shop has ever drawn a payment code. Only the wording was wrong. The box, the link it holds and the way you take payment are all unchanged, and the value still syncs between your phones through the storefront settings row - that row is how it travels, not a shop surface.

10 Sep 2026 - the back-office link is off the homepage (no new engine; the phones did not change). The homepage footer carried a small "Back-office login" line - the only public link to your app anywhere on the site - and it has been removed, so nothing on your public pages now points at /admin/. You open the app exactly as before: the **Home Screen icon** on your phone (open munchies.com.my/admin/ once in Safari, Share -> Add to Home Screen), and the login itself is unchanged - it still asks for your 4-digit PIN and your sign-in. The WhatsApp number under the footer link now also writes itself the Malaysian way **(+60 18-913 6389)** whatever you type in Settings, and it still follows **Settings -> Storefront** like the rest of the footer.

10 Sep 2026 - the app can no longer be handed a web page where it asked for a script (no new engine; the phones did not change). So the app can open without a connection, it keeps a background copy of itself. Whenever a file failed to download, that copy used to answer with the app's own **web page** - even when what had failed was a **script** or a **picture**. A browser handed a web page where it asked for a script cannot run the script, so whatever that script was meant to set up would quietly stop working, with nothing on screen to explain why. Now only a real page - opening or refreshing the app - may fall back to the stored copy; a script, a stylesheet or an image that fails simply fails, so a fault shows itself as a fault instead of hiding behind a page. Opening the app offline still works exactly as before. Your website has always run its app from /admin/, so it never had the leftover copy that caused the visible version of this fault elsewhere; the guard is in for good anyway, so it cannot start here.

10 Sep 2026 - the homepage's contact details now follow your Storefront settings (no new engine; the phones did not change). The WhatsApp number, Instagram and Facebook links in your homepage footer were typed into the page itself, so changing them under **Settings -> Storefront** moved your order page and left the homepage still showing the old ones. The homepage now reads the same published settings as the order page, so the two always quote the same number and the same handles. Leave a box blank and the homepage keeps the link it already has, so an empty box never breaks a working link. (The homepage's contact **email** has no Settings box behind it - tell me if you want one.)

10 Sep 2026 - review photos load one at a time on the homepage (no new engine; the phones did not

change). The **What customers say** section on your homepage used to fetch **every published review photo up front** - including the reviews a visitor never waited around to see. A photo is now fetched **as its review comes around**, one step ahead of time so it is ready before it slides in, and the reviews a visitor never reaches are never downloaded at all. On a phone that means less data and a quicker page, and it changes nothing about how the section looks or behaves.

A review photo is also shrunk a little harder before it is stored - to 1000 pixels across instead of 1600. The card on the homepage shows a picture no more than 340 pixels high, so the smaller copy looks just as sharp while being about **a third of the size**, which is kinder to the customer's mobile data and keeps your stored photos light. This applies to photos left from now on; the reviews already on your page keep the picture they were stored with. (Your homepage itself already loads its pictures as separate files - its page is only about 29 KB - so nothing needed changing there.)

v78 - The calendar's Add buttons now say what they do (14 Sep 2026)

On the **Delivery Dates** screen, **Mark an occasion** carried a small button reading "+ Add occasion". The name did not tell you it opens a ready-made list of Malaysia's holidays and fun days, all ticked and waiting - so you had to open it to find out. It now reads **" + Load standard occasions"**, and the window it opens is titled the same.

Inside that window there were two buttons both called "Add": the big one at the bottom that files the days you ticked, and a smaller one in the "My own day" strip just above it, which files a day you name yourself (a birthday, a one-off promo). Reaching for "Add" and hitting the wrong one gave you "Type a name first", for a day you never meant to name. The smaller one is now spelled out as **"Add my own day"**, so the only plain Add in the window is the one that adds the days you ticked. Nothing else moved - the import picker, the Untick all / Tick all buttons, the heading tick boxes, the "My own day" box and the way a day is marked on the calendar are all unchanged. Engine v78, guide v78.

v77 - The translated-text card says what a blank line means (14 Sep 2026)

A wording fix on top of the fold-away card that arrived in v76. The greyed line in a product's translated-text card used to end "blank keeps English"; it now finishes **"if blank, it will be filled with English"** - stating what the customer gets, rather than what the line does. The card's own sub-line ends the same way.

Nothing else moves. Delete what is in a line and the greyed suggestion and its arrow come back exactly as before; the card still folds on a tap outside, the right arrow still takes the words, and the circular-arrow button still re-translates that one line. Engine v77, guide v77.

v76 - The translated text is one quiet card that folds away (14 Sep 2026)

Every product's translated-text corner was the busiest part of the screen: always open, eight lines each with its own "Translate this one" button, two "Fill all" buttons above them, and an "auto" tag in a word you had to decode. It is now **one quiet card that starts shut and stays shut** - it is setup, not daily use. Tap the title to open it; tap anywhere outside to fold it back.

Opened, each empty line shows its translation **already worked out** as the app's standard greyed suggestion, with the -> at its right edge - the same gesture as every other suggested box in the app. Taking it replaces the arrow with a **circular-arrow button** that re-translates just that one line, in place. Typing your own words hides the circular-arrow button (the line is yours); a blank line keeps the English. The two "Fill all" buttons, the eight "Translate this one" buttons and the "auto" tag are gone.

A product you never open the card for still reads in all three languages on the shop - the automatic translation still runs after every save and publish. Engine v76, guide v76.

v75 - The green glow on a jumped-to order waits for you (14 Sep 2026)

Tapping a row in the **New Orders** inbox (or a result in **Find an order**) takes you to that order's delivery day and lights the order up green. That glow used to fade after under two seconds - no time at all while your eye is still travelling down a long day, so you were left hunting for a row that was no longer lit. The glow now **keeps pulsing until your finger arrives on the row**, and ends the moment you reach it.

If your phone is set to reduce motion, the same green ring holds steady instead of pulsing, so it still stays until you reach the row. Engine v75, guide v75.

v74 - The little arrow in an empty box keeps working (14 Sep 2026)

Engine v73 added the small right-arrow at the right edge of a box showing a greyed example: press -> on a keyboard, or tap the arrow, and the example drops in as real text. On a phone the tap worked the first time and then stopped - once you had tapped into any box, tapping the arrow on the next one did nothing.

Two things caused it, both about the box moving under your thumb. Taking a suggestion focused the box, which opened the phone's keyboard and shrank and panned the page, so the arrow was no longer where the finger landed; and the strip that counted the tap was narrow and measured only as a position on the page. Taking a suggestion **no longer opens the keyboard**, the strip is about **half again as wide**, and a tap is judged against the box's own edge as well as its place on the page - either reading can take the tap, so the rule can only accept a tap the old one refused, never refuse one it took.

The drawn arrow is kept exactly as it was - same size, same place - a tap on the greyed example itself is still an ordinary tap that puts the cursor there, and the sign-in and cloud boxes still carry no arrow. Engine v74, guide v74.

v73 - Change windows, moving an order, Policies, and a one-tap suggestion (14 Sep 2026)

An order is not refundable, but it can be moved to another posting day - and a customer may ask until a set number of days before the day it is due. That number is now **per product**: a new **"Changes or cancellations (days before delivery)"** box sits beside the other date rules when you edit a product. It only ever tells the customer - **blank** means no window is stated, an explicit **0** states no advance limit, and neither ever blocks you, who move every order by hand. The customer reads the sentence on the product's card and again on their green **"Order received!"** card, and when one order holds products with different windows they see the strictest (largest) figure, so a mixed basket gives one clear number. The sentence is written in **English / Mandarin / BM** with the rest of the page. The order's own track card stays silent - it is read days later, when the window may have changed.

An order's posting day can now be **changed in the app** instead of deleted and re-typed - a deletion reads as a cancellation. The **Edit order** pop-up gains a **"Delivery day"** select of every day still to come; saving moves the whole order across in one step, and heals an order whose rows had somehow ended up on different days. Soft notes under the select tell you the order's own window, warn when the new day falls inside it, say when that day has already closed, and say when it is short an item - none of them block you. The destination day's availability is checked, and the customer's tracking page is republished so it shows the new day. The old date is left for the **Del** button on the Deliveries screen to clear.

A **Policies** box in **Settings -> Storefront** holds your own cancellation and refund wording: type it once in English, translate it to Chinese and Bahasa Malaysia with the same free machine translation the product text uses, and it is drawn on your shop under **Track your order**, in the visitor's language, with the line breaks you typed. Blank hides the section.

And app-wide: wherever an empty box shows the app's greyed recommendation, the **right arrow** - or a tap on

the small arrow drawn at the box's right edge, for a phone with no arrow key - **accepts it as real text**, the same gesture as an AI chat prompt. It is offered only where the grey text really is a value: the Supabase email, key and password boxes and the sign-in fields carry no arrow, so a made-up login can never be accepted by accident. Engine v73, guide v73.

v72 - A sold-out note reads in the customer's language (10 Sep 2026)

Your order page switches language the moment a customer taps it, but two corners of it had stayed English whichever language they chose: the short note on a product that **cannot be ordered for the posting day they picked** (that it only opens from a certain date, only runs up to one, or that orders close so many days ahead - with the date written in the page's language), and the notes that appear above the menu when the page **has to change a basket** - something that just sold out, or a quantity trimmed to what is actually left.

Both now read in **English / Mandarin / BM** along with everything else. The reason a product is closed is handed to the page as a plain fact - which kind of rule, and the day or number of days behind it - and the page writes the sentence itself, so no English can slip into a Chinese or Malay page. An English visit reads word for word as it did. Engine v72, guide v72.

v71 - The order page's Mandarin / BM buttons answer instantly (10 Sep 2026)

On your order page, tapping **EN / Mandarin / BM** used to reload the whole page. That re-downloaded the page and fetched the menu, the "only N left" numbers and your saved order-page settings all over again, so each tap sat there for a moment before anything changed - and the slower the customer's connection, the longer the wait. A reload could also wipe a basket that was already half filled.

Now the order page switches **in place**, exactly like your homepage already did: the words change the moment they tap, and nothing is downloaded again. Whatever the customer has already done is left exactly as it was - the items in their basket, the posting day they picked, the name, WhatsApp number and postal address they typed - and if they are looking up an order, that card re-reads in the new language too. Nothing to set up.

v70 - An order keeps the name and price it was sold at (10 Sep 2026)

Until now an order did not remember what it was sold as - it just looked the product up afresh each time it was shown. So if you renamed a product or changed its price, **every past order changed with it**: last month's orders, the labels you printed, and even the amount a customer saw on their own tracking page all silently moved to today's wording and today's price. And if you later deleted a product, its orders fell back to "(deleted product)" with no price at all.

Now each order **freezes the name and price at the moment it is taken** - whether it came from your shop or you typed it in yourself - and every message, the tracking page, customer spend totals and the Home estimate read that frozen record. Rename or reprice a product and the past stays as it was; a product you delete later still shows what it was that someone bought.

Two careful edges: if you deliberately **swap a line to a different product** when editing an order, that line picks up the new product's price (you changed what is being sold), while a line you leave untouched keeps the price it was sold at. And orders taken **before** today are stamped just once with what they were already showing, so they stop moving from here on - a line whose product is gone, or has no price set, is left alone rather than guessed at. Engine v70, guide v70.

v69 - Either place updates the customer (10 Sep 2026)

Yesterday's fix put a customer's name and number back in one place - but it made the **customer card** the side that always won, so if the card and an order disagreed, the card's name was the one shown. That is no longer the rule: now it is simply **whichever you edited last**. Correct a customer's name with **Edit** on one of their orders

and that is the name the list, the history pop-up and the "Hi {name}!" greeting use; open their card, type the name and save, and the card's is the one used. Either place updates the customer - neither is the boss. They normally read the same anyway, because each save writes through to the other side; this only decides the rare case where an old copy and a newer one are both sitting there. Nothing to set up; the phones pick it up with the next sync.

v68 - One name and one number per customer (10 Sep 2026)

A customer's name and WhatsApp number used to be held in two places at once - on their orders, and on their customer card - and the two did not always agree. If you opened a customer and typed their name on their card, the customer list could carry on showing the old one, because it read the name off the order. And renaming someone who has **no WhatsApp number** on file could lose them: the name is what ties a numberless customer to their history, so the new name slid off their orders and appeared nowhere at all.

Now the name and number you save on a customer are the ones that count, and fixing them once fixes them everywhere: saving their card writes the name and number onto **every order they have**, so the labels, the WhatsApp messages and the customer list all follow. It works the other way round too - correct a wrong number with **Edit** on an order and that customer's card updates as well, so the two can never drift apart again. Correcting a number carries that customer's bring-a-friend credits across with it, and renaming someone who has no number no longer loses them.

Leaving a box empty means "leave this as it is" - it never wipes a number your confirmations depend on. And if you renamed anyone before today and it never stuck, the app puts their orders right the first time this version opens. Engine v68, guide v68.

9 Sep 2026 - the wish list's automatic email went live (no new engine; the phones did not change).

Adding a wish on **More -> Software wish list** now emails the **full wish list** - every wish, ticked or not, newest first, with the app version and the date - to the developer address(es) you set under Settings -> **Website & developer**, all on its own, whenever the phone is signed in and sharing data. Before today that automatic email needed a behind-the-scenes service that was not switched on yet, so only the **"Email the full wish list"** row sent it by hand; that row is still there as a backup any time.

v67 - Naming a "No name" customer (10 Sep 2026)

A customer who reached you without a name - a storefront order that carried none - used to stay **"No name"** in your customer book even after you opened them and typed a name. Now it sticks: open them, tap **Add details**, type the name (and the pet's name, what they like, and so on) and save, and their row shows that name straight away - in the list, the finder and the 'Hi {name}!' WhatsApp greeting. A tidy-up; nothing else about your customers changes. Engine v67, guide v67.

v66 - Products that translate themselves + Draft / On the shop / Hidden (9 Sep 2026)

Product text now translates itself into Mandarin and Bahasa Malaysia. When you save or publish a product, the app quietly fills Chinese and Malay versions of its name, description, selling unit and feeding tip - machine-made from your English, free, whenever you're online. Each translated box is tagged **"auto"**. Type over any box and it becomes yours, never overwritten again; and in **Products -> Edit** you can tap **Fill all Mandarin / Fill all Bahasa Malaysia** to fill a whole language now, or **circular-arrow button Translate this one** for a single line. If you later change the English, the box is re-filled to match; delete the English and the translation is dropped. Shoppers reading in that language then see the product in their own words on your order page.

Products now have three states, shown as three lists - **On the shop** (live, orderable), **Draft** - **not on the shop yet** (a brand-new product starts here, fully built but not for sale), and **Hidden** - **taken down** (off the menu, history and recipe kept). Publish a draft to put it on the shop; Hide a live product to pause it. Drafts and Hidden

products never appear on the storefront and can't be ordered, so building a new recipe can't accidentally go live.

The "Copy follow-up" referral message now has a language choice. In a customer's profile, before you copy the follow-up, pick **English / Mandarin / BM** - the whole check-in (greeting, the product's translated name and feeding tip, the scheme pitch, the link) is written in that language, ready to paste into WhatsApp. English stays the default. No SQL this version.

v65 - Reviews to publish, one at a time (9 Sep 2026)

More -> Reviews now walks you through the reviews **one at a time**, drawing each exactly as it will look on your homepage (photo, stars, message, name). The ones waiting for you to publish come first; **Publish** puts it on the homepage, **Take down** hides it again, **Delete** removes it for good - and every action moves you on to the next review. It deliberately does not auto-play, because you are deciding, not watching: the review in front of you stays until you move it with the ? ? arrows, the dots, or a swipe.

Two places now tell you when reviews are waiting on you: **Home** shows an "? N new review(s) to publish" card near the top (tap it straight into Reviews), and the ? **Reviews** row on More gains a green "N waiting" pill. The count refreshes every ~45 seconds while Home is open. No SQL this version.

v64 - Your site in Mandarin / English / Bahasa Malaysia + a website credit (9 Sep 2026)

Your **homepage and ordering page now speak three languages**. Tap **English / Mandarin / BM** at the top of either page and every word - navigation, product cards, the delivery-day and order form, even the track page - switches over on the spot, and each phone remembers the language it picked. Because the choice lives in the browser, one shop link serves every customer in their own language. Each product can also carry a Chinese or Malay **shop name** in Products (e.g. ???? or Jerky Ayam): it shows on the product card while the order and your records keep the English name.

The homepage **reviews** section is now a **swipeable carousel** - drag left or right through the reviews you have published, or tap the dots - and if your website was built for you, **Settings -> Website & developer** lets you name who made it. A small "**Website by ...**" credit then appears at the bottom of your homepage and order page, and **More -> About** adds a WhatsApp and an email row to reach them. That same developer is who the **software wish list** emails: add a wish on More and the whole list is sent to them automatically (quietly - if it can't send, a gentle note points you to the always-works "**? Email the full list**" row underneath). The credit and the email links stay hidden until you type a name and an email in Settings.

v63 - Customers tab, wish list, holidays fix (8 Sep 2026)

Customers is a real tab of its own, swapped with **Purchase Order** (now under **More -> Purchase Order**). The tab stays your automatic customer list - who ordered, how much, their favourite - and now every person can carry a **profile** (the **Edit** button in their history pop-up): their pet's name and a small photo (auto-shrunk to a thumb), what they like, what to avoid, and a note. Profiles save into a synced customers collection, so both phones know the same people, and they build up quietly for a future AI chat about your customers. A **finder** box at the top of the tab filters the list as you type - name, number, pet's name, likes, notes - and says how many match, just like "Find an order" on Orders. A saved profile shows as a paw or photo beside the name and a small line under the row.

On **Home**, the "Upcoming holidays" card is fixed: it used to vanish whenever nothing was marked on the Delivery calendar. It is now always there - up to three marks at a glance, a scroll for any more, and a friendly empty state that still opens the calendar so you can add days.

On **More**, a small green **Engine v63** pill (in the header card) shows which build this phone runs, a **Software wish list** sits at the bottom and behaves exactly like your to-do list (add, tick, reword, remove - a tick stays

ticked and never touches the weekly routine), and **Full change history** opens this history as a PDF kept on your website. No SQL this version.

v62 - "Not sharing" strip + read-only View (8 Sep 2026)

When a phone is not on the shared cloud - shared data off, never set up, or signed out - a thin amber strip at the very top of every screen reads "**Not sharing right now**" with a one-line reason and a **Fix it** tap straight to Settings -> Shared data. It never locks the app, and it disappears on its own the moment sharing is back on. (Set up once per phone: no SQL - the shared-data setup you already did covers it.)

Also, every backup copy in Settings -> **Backup & safety** now has a **View** button: a purely read-only look inside that copy - its orders grouped by delivery date (customer, product, quantity, status), the product price list and ingredient stock at that time. Looking at a June price confirms the detail without moving today: no rewind, nothing written, ever.

v61 - Cloud backups (8 Sep 2026)

Every time the app opens while signed in, it quietly saves a full **Daily** copy (first open each day), a **Weekly** copy (Mondays) and a **Monthly** copy (the 1st) to your own Supabase cloud, keeping the newest 7 daily / 4 weekly / 3 monthly. A "Back up to cloud now" button, and one "Before restore" copy saved before every restore, stay until you delete them. Each copy can be **Restored** (steps the phone - and the shared cloud - back to that copy; a "Before restore" copy is always saved first, so it is never one-way), **Downloaded** as `furkidz-backup-YYYY-MM-DD-KIND.json` (which re-imports like an Export), or **Deleted**. Lives under More -> Settings -> "Backup & safety". The copies never contain the per-phone app-login email/password or the app password. Setup: run `supabase/backups.sql` once.

v60 - Homepage customer reviews (8 Sep 2026)

Customers can leave a **What customers say** review on the homepage - name, 1-5 stars, a message in English / Mandarin / Bahasa Malaysia, and an optional photo. Every review lands *unpublished* in More -> Reviews, where **Publish** shows it on the homepage, **Take down** hides it, and **Delete** removes it - nothing becomes public until you tap Publish. Reviews appear on the homepage only. Setup: run `supabase/reviews.sql` once.

v59 - Occasion import tidy-up (8 Sep 2026)

Added **World Animal Day** (4 Oct) to the fun/pet-day import, plus whole-group ticking - tick a heading box, or use **Untick all** / **Tick all**.

v58 - Occasion import (8 Sep 2026)

A one-tap + **Add occasion** import of Malaysia's days plus fun days (pet, people & kindness days, and more), and a **My own day** quick-add.

v57 - Private notes per product ingredient (8 Sep 2026)

Each ingredient line in a product can carry a short private description *for that product only* (e.g. which cut or brand of chicken that product uses). Typed and seen on the Products screens only - never on the shop, a label, or the product cards.

v56 - "Keep at least" reserve (8 Sep 2026)

Ingredients can set a **Keep at least** level. The order list tops an ingredient back up to that level in whole packs when your stock drops more than 10% under it, and low items ride along even when today's posting run doesn't use them. The Ingredients screen shows a red low-stock strip.

v55 - Time & length units (7 Sep 2026)

min/hr and **cm/m** are pre-loaded in Units (under More), like g/kg - so oven or dehydrator times and treat sizes can be measured and converted (1 hr = 60 min, 1 m = 100 cm). Stock is guarded so a time or length unit can never distort a gram count.

v54 - Ingredients on hand (7 Sep 2026)

Ingredients now have **On hand** stock. The PO buys only what you don't have (rows you already have drop out), "Bought" on a saved list adds its packs once, and marking an order **Preparing** (the engine step the bakery calls "Baked") subtracts its ingredients (undo restores them).

This history covers the two-phone cloud era (v54+). Earlier versions (pre-v54) were never recorded version by version, so they are not listed here rather than invented. Each new version is added here as it ships.
